5-Amino-1*H*-pyrazol-2-ium hydrogen succinateThammarse S. Yamuna,<sup>a</sup> Manpreet Kaur,<sup>a</sup> Brian J. Anderson,<sup>b</sup> Jerry P. Jasinski<sup>b\*</sup> and H. S. Yathirajan<sup>a</sup><sup>a</sup>Department of Studies in Chemistry, University of Mysore, Manasagangothri, Mysore 570 006, India, and <sup>b</sup>Department of Chemistry, Keene State College, 229 Main Street, Keene, NH 03435-2001, USA

Correspondence e-mail: jjasinski@keene.edu

Received 21 January 2014; accepted 22 January 2014

Key indicators: single-crystal X-ray study;  $T = 173$  K; mean  $\sigma(\text{C}-\text{C}) = 0.003$  Å;  $R$  factor = 0.071;  $wR$  factor = 0.212; data-to-parameter ratio = 21.5.

In the cation of the title salt,  $\text{C}_3\text{H}_6\text{N}_3^+\cdot\text{C}_4\text{H}_5\text{O}_4^-$ , the protonated pyrazolium ring is planar (r.m.s. deviation = 0.012 Å). An intramolecular  $\text{C}-\text{H}\cdots\text{O}$  hydrogen bond occurs in the anion. In the crystal,  $\text{N}-\text{H}\cdots\text{O}$  hydrogen bonds and a weak  $\text{C}-\text{H}\cdots\text{O}$  interaction between the cations and anions form two sets of  $R_2^2(8)$  graph-set ring motifs. Intermolecular  $\text{O}-\text{H}\cdots\text{O}$  hydrogen bonds between these lead to a criss-cross pattern along the  $b$  axis. In addition to the classical hydrogen bonds, a weak  $\text{C}-\text{H}\cdots\pi$  (pyrazolium) interaction is observed and contributes to crystal packing. All of these interactions link the molecules into a two-dimensional supramolecular framework parallel to  $(10\bar{1})$ .

## 5-Amino-1*H*-pyrazol-2-ium hydrogen succinate

Thammarse S. Yamuna, Manpreet Kaur, Brian J. Anderson, Jerry P. Jasinski and H. S. Yathirajan

### S1. Experimental

#### S1.1. Synthesis and crystallization

A mixture of commercially available 3-aminopyrazole (0.5 g, 6.02 mmol) and succinic acid (0.71 g, 6.02 mmol) were dissolved in 5 ml of hot dimethylsulfoxide. The reaction mixture was stirred for 15 mins at 323 K. The resulting solution was allowed to cool slowly at room temperature upon which X-ray quality crystals of the title salt were obtained after few days; M.pt: 368–373 K.

#### S1.2. Refinement

The N-bound H2A and H3A atoms were located by a difference map and refined isotropically. All of the remaining H atoms were placed in their calculated positions and then refined using the riding model with atom—H lengths of 0.93 Å (CH); 0.97 Å (CH<sub>2</sub>); 0.82 Å (OH) or 0.86 Å (NH). Isotropic displacement parameters for these atoms were set to 1.2 (CH, CH<sub>2</sub>, NH) or 1.5 (OH) ×  $U_{eq}$  of the parent atom.

### S2. Results and discussion

Pyrazoles comprise an important class of heterocyclic compounds and many pyrazole derivatives are reported to have a broad spectrum of biological properties, such as anti-bacterial and anti-inflammatory activities, anti-cancer (Hall *et al.*, 2009). The chemistry of aminopyrazoles has been extensively investigated in the past. The considerable biological and medicinal activities of pyrazoles (Vinogradov *et al.*, 1994), for which aminopyrazoles are preferred precursors, have stimulated these investigations. Succinic acid derivatives are also mostly being used in chemicals, food and pharmaceuticals (Sauer *et al.*, 2008). Recently, the crystal structure of 3-aminopyrazolium trifluoroacetate (Yamuna *et al.*, 2013) was reported from our research group. Some other structures of related compounds, *viz.*, 4-[bis(4-fluorophenyl)methyl]-1-[(2*E*)-3-phenylprop-2-en-1-yl]piperazin-1-ium 3-carboxypropanoate (Kavitha *et al.*, 2013), doxylamine hydrogen succinate (Parvez *et al.*, 2001), 5-amino-4-methylsulfonyl-1-phenyl-1*H*-pyrazole (Kettmann *et al.*, 2005) and ethyl 1-acetyl-3-amino-1*H*-pyrazole-4-carboxylate (Koziol *et al.*, 2006) have also been reported. In continuation of our work on pyrazoles, this paper reports the crystal structure of the title salt, 5-amino-1*H*-pyrazol-2-ium hydrogen succinate, C<sub>3</sub>H<sub>6</sub>N<sub>3</sub><sup>+</sup>·C<sub>4</sub>H<sub>5</sub>O<sub>4</sub><sup>-</sup>, (I).

The title salt, (I), crystallizes with one independent monocation (A) and a monoanion (B) in the asymmetric unit (Fig. 1). In the cation the protonated pyrazolium ring is planar. In the crystal, N—H···O hydrogen bonds involving two hydrogen atoms on the amino group (H1AA, H1AB), a N2A—H2A···O3B intermolecular hydrogen bond and a weak C2A—H2AA···O1B intermolecular interaction between cations and anions form two sets of R<sub>2</sub><sup>2</sup>(8) graph set ring motifs (Fig. 2). Intermolecular O—H···O hydrogen bonds between the anions leads to a criss-cross pattern along the *b* axis. In addition to the classical hydrogen bonds, a weak C—H···Cg(pyrazolium) intermolecular interaction is observed and contributes to crystal packing. All of these interactions directly link the molecules into a 2D supramolecular framework

along (1 0 -1).

**Figure 1**

ORTEP drawing of (I) ( $C_3H_6N_3^+ \cdot C_4H_5O_4^-$ ) showing the labeling scheme with 30% probability displacement ellipsoids. Dashed lines indicate a  $C3A-H3AA \cdots O1B$  intermolecular hydrogen bond linking the cation and anion within the asymmetric unit.

**Figure 2**

Molecular packing for (I) viewed along the *a* axis. Dashed lines indicate O—H···O, N—H···O hydrogen bonds and weak C—H···O intermolecular interactions forming  $R_2^2(8)$  graph set ring motifs. H atoms not involved in hydrogen bonding have been removed for clarity.

 $w = 1/[\sigma^2(F_o^2) + (0.1004P)^2]$   
 where  $P = (F_o^2 + 2F_c^2)/3$   
 $(\Delta/\sigma)_{\text{max}} < 0.001$   
 $\Delta\rho_{\text{max}} = 0.36 \text{ e } \text{\AA}^{-3}$   
 $\Delta\rho_{\text{min}} = -0.40 \text{ e } \text{\AA}^{-3}$

### Special details

**Geometry.** All esds (except the esd in the dihedral angle between two l.s. planes) are estimated using the full covariance matrix. The cell esds are taken into account individually in the estimation of esds in distances, angles and torsion angles; correlations between esds in cell parameters are only used when they are defined by crystal symmetry. An approximate (isotropic) treatment of cell esds is used for estimating esds involving l.s. planes.

### Hydrogen-bond geometry ( $\text{\AA}$ , $^\circ$ )

Cg1 is the centroid of the pyrazolium ring.

$D-H\cdots A$	$D-H$	$H\cdots A$	$D\cdots A$	$D-H\cdots A$
