Received 24 March 2014; accepted 11 April 2014

Key indicators: single-crystal X-ray study; T = 293 K; mean σ (C–C) = 0.003 Å; disorder in main residue; R factor = 0.052; wR factor = 0.152; data-to-parameter ratio = 15.0.

The title compound, C₂₀H₁₅N₃OS, is V-shaped. In the 4phenoxyphenyl group, the two rings are inclined to one another by 74.52 (13)°. These rings are inclined to the triazole ring by 72.20 (15) and 72.30 $(15)^\circ$, respectively. The phenyl ring is inclined to the triazole ring by $10.85 (12)^{\circ}$. In the crystal, molecules are linked via N-H···N hydrogen bonds, forming chains propagating along [010]. These chains are linked via pairs of $C-H \cdot \cdot \cdot S$ hydrogen bonds, forming sheets lying parallel to the *ac* plane.

3-[(4-Phenoxyphenyl)sulfanyl]-5-phenyl-1H-1,2,4-triazole

Raja Ben Othman, Mathieu Marchivie, Franck Suzenet and Sylvain Routier

S1. Comment

From a medicinal chemistry point of view, it is of great interest to develop efficient methods for the synthesis and the functionalization of 1,2,4-triazoles, as they are known to possess a wide range of biological activities, such as, as anticancer (Holla *et al.*, 2002, 2003) antitubercular (Walczak *et al.*, 2004), antimicrobial (Zitouni *et al.*, 2005; Prasad *et al.*, 2009; Wael *et al.*, 2012), anticonvulsant (Almasirad *et al.*, 2004), anti-inflammatory, analgesic (Amir & Shikha, 2004), antidepressant (Kane *et al.*, 1988), and urease inhibitors (Akhtar *et al.*, 2010). Thus, the synthesis of 1,2,4-triazoles and the investigation of their chemical and biological behaviour have acquired more importance in recent decades for these reasons.

An efficient and convenient method was developed for the formation of substituted thiotriazoles via an organometallic addition and subsequent ring opening sequence of 3-substituted-[1,2,4]triazolo[3,4-][1,3,4]thiadiazole. This method is applicable to a wide range of substrates containing different functional groups and furnishes excellent yields of the corresponding unsubstituted 3 or 5-alkyl, aryl, alkynyl and alkenyl sulfanyl-1,2,4-triazole products.

Interestingly, working with sulfur-containing heterocycles may provide unexpected results and we report herein on the crystal structure of one derivative obtained within an unprecedented series of results (Ben Othman *et al.*, 2014).

The molecular structure of the title molecule is illustrated in Fig. 1. The molecule is V-shaped about atom S1. In the 4-phenoxyphenyl group the two rings (C9-C14 and C15-C20) are inclined to one another by 74.52 (13) °. These rings are inclined to the triazole ring (N1-N3/C7/C8) by 72.20 (15) and 72.30 (15) °, respectively. The phenyl ring (C1-C6) is inclined to the triazole ring by 10.85 (12) °.

In the crystal, molecules are linked via N-H…N hydrogen bonds forming chains propagating along [010]; see Table 1 and Fig. 2. These chains are linked via pairs of C-H…S hydrogen bonds forming sheets lying parallel to the ac plane (Table 1 and Fig. 2).

S2. Experimental

For the synthesis of the title compound, see Fig. 3. In a 25 ml flask, phenyl ZnBr solution in THF (1.5 mmol, 0.5*M*) was added drop wise under argon at room temperature to a solution of 3-Phenyl-[1,2,4]triazolo[3,4-*b*][1,3,4]thiadiazole (0.5 mmol) in THF (5 ml), and the mixture was stirred for 25 min (see Fig 3). At the end of the reaction, the mixture was quenched with 15 mL of an aqueous solution of saturated NH₄Cl, and extracted with CH₂Cl₂ (2 × 20 ml). The extract was dried over magnesium sulfate, filtered and concentrated *in vacuo*. The residue was purified by flash column chromatography on silica gel (eluent 6:4 petroleum ether/AcOEt). The title compound was obtained as a white solid in 80% yield. $R_f = 0.60$ (petroleum ether/EtOAc, 6:4); M.p. 318-320 K. HRMS (EI—MS): *m/z* calcd for C₂₀H₁₅N₃OS: 346.10086 [*M* + H]⁺, found: 346.10112. Crystals of the title compound were obtained by vapor diffusion of petroleum ether into a solution of the title compound in a CH₂Cl₂/Et₂O/pentane mixture. Spectroscopic data for the title compound is available in the archived CIF.

S3. Refinement

The NH H atom was located in a difference Fourier map and freely refined. The C-bound H atoms were included in calculated positions and treated as riding atoms: C-H = 0.93 Å with $U_{iso}(H) = 1.2U_{eq}(C)$.

Figure 1

The molecular structure of the title molecule, with atom labelling. Displacement ellipsoids are drawn at the 30% probability level.

Figure 2

A perspective view along the b axis of the crystal pack of the title compound. Hydrogen bonds are shown as dashed lines (see Table 1 for details; H atoms not involved in hydrogen bonding have been omitted for calrity).

Figure 3

The synthetic route of the title compound.

Special details

Experimental. Spectroscopic data for the title compound: IR (ATR diamond): v (cm⁻¹) = 3082, 2927, 2864, 1581, 1482, 1324, 1242, 1006, 869, 786, 601, 725, 688; ¹H NMR (400 MHz, CDCl₃) δ (p.p.m.) = 12.92 (br. s, 1H), 7.90 (d, J = 6.9 Hz, 2H), 7.47 (d, J = 8.4 Hz, 2H), 7.43–7.28 (m, 5H), 7.15 (t, J = 7.3 Hz, 1H), 6.96 (d, J = 7.8 Hz, 2H), 6.84 (d, J = 8.4 Hz, 2H); ¹³C NMR DEPT (101 MHz, CDCl₃): δ (p.p.m.) = 134.9 (2CH_{Ar}), 130.2 (CH_{Ar}), 129.9 (2CH_{Ar}), 128.8 (2CH_{Ar}), 126.5 (2CH_{Ar}), 124.1 (CH_{Ar}), 119.7 (2CH_{Ar}), 119 (2CH_{Ar}).

Geometry. All e.s.d.'s (except the e.s.d. in the dihedral angle between two l.s. planes) are estimated using the full covariance matrix. The cell e.s.d.'s are taken into account individually in the estimation of e.s.d.'s in distances, angles and torsion angles; correlations between e.s.d.'s in cell parameters are only used when they are defined by crystal symmetry. An approximate (isotropic) treatment of cell e.s.d.'s is used for estimating e.s.d.'s involving l.s. planes.
