In the title  $\beta$ -thiocarbonyl compound,  $C_{16}H_{16}O_2S$ , the carbonyl and methoxy O atoms are approximately coplanar [ $O-C-C-O$  torsion angle =  $-18.2(5)^\circ$ ] and *syn* to each other, and the tolyl ring is orientated to lie over them. The dihedral angle between the planes of the two rings is  $44.03(16)^\circ$ . In the crystal, supramolecular chains are formed along the *c* axis mediated by  $C-H \cdots O$  interactions involving methine and methyl H atoms as donors, with the carbonyl O atom accepting both bonds; these pack with no specific intermolecular interactions between them.

**Keywords:** crystal structure;  $\beta$ -thiocarbonyl;  $C-H \cdots O$  interactions.

**CCDC reference:** 1035425

## Crystal structure of 2-methoxy-2-[(4-methylphenyl)sulfanyl]-1-phenylethan-1-one

**Julio Zukerman-Schpector, Paulo R. Olivato, Henrique J. Traesel, Jéssica Valença, Daniel N. S. Rodrigues and Edward R. T. Tiekink**

### S1. Introduction

As part of our on-going research on the conformational and electronic interactions of some  $\beta$ -thio-carbonyl and  $\beta$ -bis-thio-carbonyl compounds, e.g. N,N-diethyl-2-[(4-substituted) phenylthio]acetamides, 1-methyl-3-phenylsulfonyl-2-piperidone, 3,3-bis[(4-substituted)phenylsulfanyl]-1-methyl-2-piperidones, 2-alkylthio-2-alkylsulfinyl-acetophenones, 2-alkylthio-2-phenylsulfonyl-acetophenones and 2-alkylsulfinyl-2-alkylsulfonyl-acetophenones, utilizing spectroscopic, theoretical and X-ray diffraction methods (Vinhato *et al.*, 2013; Zukerman-Schpector *et al.*, 2008; Olivato *et al.*, 2013; Distefano *et al.*, 1996) the title compound was synthesized and its crystal structure determined.

### S2. Experimental

#### S2.1. Synthesis and crystallization

4-Methylthiopenol (5.0 g, 40 mmol) was reacted with bromine (1.1 ml, 20 mmol) in dichloromethane (250 mL) on hydrated silica gel support (25 g of SiO<sub>2</sub> and 12 mL of water) to give 4-methylphenyl disulfide (4.1 g, yield = 83%). A white solid was obtained after filtration and evaporation without further purification (Ali & McDermott, 2002). A solution of 2-methoxy acetophenone (0.4 mL, 2.76 mmol, Sigma-Aldrich) in THF (10 ml) was added drop wise to a cooled (195 K) solution of diisopropylamine (0.42 ml, 3.04 mmol) and butyllithium (2.0 ml, 2.76 mmol) in THF (10 ml). After 30 minutes, a solution of 4-methylphenyl disulfide (0.748 g, 3.04 mmol) with hexamethylphosphoramide (HMPA) (0.5 ml, 2.76 mmol) dissolved in THF (10 ml) was added drop wise to the enolate solution (Zoretic & Soja, 1976). After stirring for 3 h, water (50 ml) was added at room temperature and extraction with diethyl ether was performed. The organic layer was then treated with a saturated solution of ammonium chloride until neutral pH and dried over anhydrous magnesium sulfate. A brown oil was obtained after evaporation of the solvent. Purification through flash chromatography with n-hexane was used to remove the non-polar reactant (disulfide) then acetone to give a mixture of both acetophenones (product and reactant). Crystallization was performed by vapour diffusion of n-hexane into a chloroform solution held at 283 K to give pure product (0.3 g, yield = 40%). Suitable crystals for X-ray diffraction were obtained by same pathway; m.p. 359.3–359.8 K.

<sup>1</sup>H NMR (CDCl<sub>3</sub>, 500 MHz, ppm):  $\delta$  2.33 (s, 3H), 3.67 (s, 3H), 5.81 (s, 1H), 7.08–7.10 (m, 2H), 7.23–7.25 (m, 2H), 7.43–7.46(m, 2H), 7.56–7.59 (m, 1H), 7.95–7.96 (m, 2H). HRMS: calcd. for C<sub>16</sub>H<sub>16</sub>O<sub>2</sub>S [M + H]<sup>+</sup> 272.0871; found: 272.0864.

## S2.2. Refinement

Carbon-bound H-atoms were placed in calculated positions ( $C-H = 0.93$  to  $0.98$  Å) and were included in the refinement in the riding model approximation, with  $U_{iso}(H) = 1.2-1.5U_{eq}(C)$ .

### Special details

**Geometry.** All e.s.d.'s (except the e.s.d. in the dihedral angle between two l.s. planes) are estimated using the full covariance matrix. The cell e.s.d.'s are taken into account individually in the estimation of e.s.d.'s in distances, angles and torsion angles; correlations between e.s.d.'s in cell parameters are only used when they are defined by crystal symmetry. An approximate (isotropic) treatment of cell e.s.d.'s is used for estimating e.s.d.'s involving l.s. planes.
