Crystal structure of the α -racemate of methohexital

Thomas Gelbrich* and Ulrich J. Griesser

Institute of Pharmacy, University of Innsbruck, Innrain 52c, 6020 Innsbruck, Austria. *Correspondence e-mail: thomas.gelbrich@uibk.ac.at

Molecules of the title compound, $C_{14}H_{18}N_2O_3$ [systematic name: 5-allyl-5-(hex-3-yn-2-yl)-1-methylpyrimidine-2,4,6(1H,3H,5H)-trione in the $(R_bS_h)/(S_bR_h)$ racemic form], are connected by mutual $N-H\cdots O$ —C hydrogen bonds in which the carbonyl group at the 2-position of the pyrimidinetrione ring is employed. These interactions result in an inversion dimer which displays a central $R_2^2(8)$ ring motif. This dimer is topologically distinct from that of the previously reported (S_bR_h) form, which is, however, also based on an $R_2^2(8)$ motif. The methyl group at the 1-position of the pyrimidinetrione ring in the title structure is disordered over two sets of sites in a 0.57 (2):0.43 (2) ratio.

1. Chemical context

The title compound is a barbiturate derivative, the Na salt of which (trade name Brevimytal, Eli Lilly) is a widely used short-acting anaesthetic with a rapid onset of action. The molecule contains two asymmetric centres and can exist as two diastereomeric enantiomer pairs. Its stereoisomerism is known to affect the anaesthetic activity and possible side effects of the drug (Gibson *et al.*, 1959). The crystal structure of the (S_bR_h) form of methohexital was previously reported by Brunner *et al.* (2003), who also established that the commercial product $(\alpha$ -racemate) consists of the (R_bS_h) and (S_bR_h) isomers.

$$H_3$$
C CH_3 CH_3 CH_3 CH_4 CH_5 CH_5

2. Structural commentary

This study confirmed the presence of the $(R_bS_h)/(S_bR_h)$ racemate. The molecule (Fig. 1) displays an approximately planar pyrimidinetrione unit in which the oxygen atoms of the C2 and C4 carbonyl groups lie at distances of -0.160 (2) and 0.156 (2) Å from the mean plane of the six-membered ring (r.m.s. deviation = 0.046 Å). The conformation of the two 5-substituents of the ring is characterized by three parameters, the torsion angles C5–C7–C8–C9 of -103.3 (2) and C10–C5–C7–C8 of -171.51 (13)° and the pseudo-torsion angle C5–C10···C13–C14 of 23.2 (2)°.

The previously reported (S_bR_h) form contains two independent molecules (denoted A and B), which differ from the

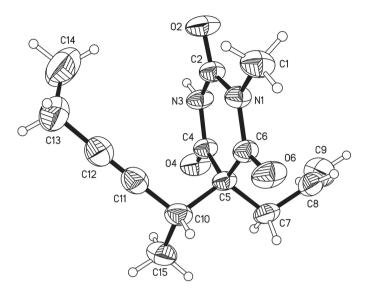

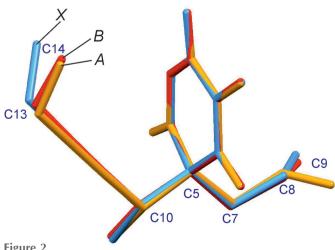

Figure 1
The molecular structure of the title compound with displacement ellipsoids drawn at the 50% probability level; hydrogen atoms are drawn as spheres of arbitrary size.

molecule of the title structure in the conformation adopted by the terminal groups of both 5-substituents (Fig. 2). Specifically, in molecule A, the torsion angle analogous to C5–C7–C8–C9 in the present α -racemate is 125.3°, and the pseudo-torsion angles analogous to C5–C10···C13–C14 of the title structure are -15.4° (A) and -26.3° (B).

3. Supramolecular features

Two molecules are linked to one another by two mutual antiparallel $N-H\cdots O=C$ bonds so that an inversion dimer is formed (Table 1, Fig. 3), which displays a central $R_2^2(8)$ ring motif (Etter *et al.*, 1990; Bernstein *et al.*, 1995). This interaction involves the carbonyl group at the 2-position of the ring. The

Overlay of the molecule of the α -racemate (denoted X) with the two independent molecules (A, B) of the previously reported (S_bR_h) form, generated by least-squares fits of their 1-methyl-2,4,6-pyrimidinetrione units (ten non-H atomic positions).

Table 1 Hydrogen-bond geometry (\mathring{A} , $\mathring{\circ}$).

$D-\mathrm{H}\cdots A$	D-H	$H \cdot \cdot \cdot A$	$D \cdot \cdot \cdot A$	$D-\mathrm{H}\cdots A$
$N3-H3\cdots O2^{i}$	0.85 (2)	2.03 (2)	2.8826 (17)	173.2 (17)

Symmetry code: (i) -x, -y, -z + 1.

 $R_2^2(8)$ ring motif is also present in the (S_bR_h) form (Brunner *et al.*, 2003) where it connects the two crystallographically independent molecules. However, in this case the dimer is based on two topologically distinct $N-H\cdots O$ —C interactions which involve the carbonyl groups at the 4-position of the ring of molecule A and at the 2-position of molecule B.

4. Database survey

The Cambridge Structural Database (Groom & Allen, 2014; Version 3.35) contains 11 unique entries for derivatives of barbituric acid which are analogous to the title compound and substituted at the 1-position, but not at the 3-position of the six-membered ring. A common characteristic of these compounds is the presence of one hydrogen-bond donor group (NH) and three potential acceptor groups, *viz.* the carbonyl groups at the ring positions 2, 4 and 6. Thus, three topologically distinct hydrogen-bonding acceptor interactions are possible. Additionally, there is a competition between possible dimer and catemer motifs, which is similar to the competition between hydrogen-bonded dimer and catemer motifs between carboxyl groups (Beyer & Price; 2000) or carboxamide groups (Arlin *et al.*, 2010, 2011).

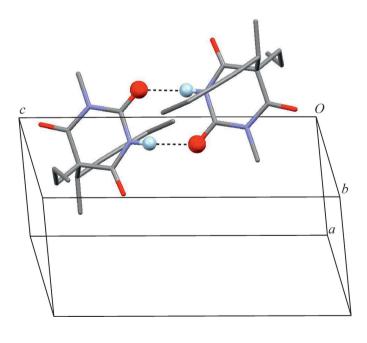

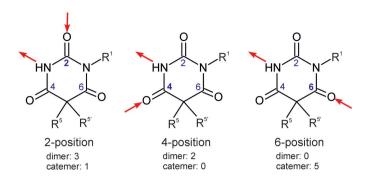

Figure 3 The N-H···O—C hydrogen-bonded inversion dimer displaying a central $R_2^2(8)$ ring. These interactions (dotted lines) involve the carbonyl group at the 2-position of the six-membered ring. O and H atoms engaged in hydrogen bonding are drawn as spheres.

The three fundamental connection modes for the formation of N—H···O—C bonds in 1-substituted derivatives of barbituric acid arising from the involvement of different carbonyl groups, and the corresponding numbers of observed dimer and catemer isomers. The (S_bR_h) form of methohexithal contains a dimer with mixed N—H···O—C2/N—

H···O=C4 connectivity and was therefore not included.

Closer inspection of the geometric possibilities (Fig. 4) shows that dimer formation is feasible for N−H···O=C2 and N−H···O=C4 connections only, whereas N−H···O=C6 should be the preferred connection mode for chain formation. Indeed, five crystal structures containing N−H···O=C6 chain motifs are known and their CSD refcodes are DMCYBA01 (Nichol & Clegg, 2005), DULMED (Gelbrich *et al.*, 2010), MDEBAR (Wunderlich, 1973), MIBABA (Wilhelm & Fischer, 1976), OBIPUM (Gelbrich & Griesser, 2009). So far, the crystal structure with refcode VEMQUB (Savechenkov *et al.*, 2012) is the only example in the set where another chain type, *viz.* N−H···O=C2, is present.

Apart from the title structure, two analogues with refcodes CXALBA (Dideberg *et al.*, 1975) and DULMAZ (Gelbrich *et al.*, 2010) also form $N-H\cdots O$ —C2 bonded dimers. The alternative $N-H\cdots O$ —C4 dimer was observed in the two structures with refcodes ALLBTC (Pyżalska *et al.*, 1980) and MEPBAB01 (Lewis *et al.*, 2005). The (S_bR_h) form of methohexital provides the only case of a dimer based on a mixed $N-H\cdots O$ —C2/ $N-H\cdots O$ —C4 connectivity.

5. Synthesis and crystallization

The crystals investigated in this study were obtained at room temperature, by slow evaporation from an aqueous solution of the α -racemate of methohexital (Lilly Research Centre Ltd., Windlesham, England).

6. Refinement

Crystal data, data collection and structure refinement details are summarized in Table 2. H atoms were identified in difference maps. The H atoms of the C14 methyl group and disordered C1 methyl group [occupancy ratio 0.57 (2):0.43 (2)] were idealized and included as rigid groups allowed to rotate but not tip (C-H = 0.96 Å) and refined with $U_{\rm iso}$ set to $1.5U_{\rm eq}(\rm C)$ of the parent carbon atom. H atoms bonded to secondary CH₂ (C-H = 0.97 Å), tertiary CH (C-H = 0.98 Å)

Table 2 Experimental details.

Special details

Geometry. All e.s.d.'s (except the e.s.d. in the dihedral angle between two l.s. planes) are estimated using the full covariance matrix. The cell e.s.d.'s are taken into account individually in the estimation of e.s.d.'s in distances, angles and torsion angles; correlations between e.s.d.'s in cell parameters are only used when they are defined by crystal symmetry. An approximate (isotropic) treatment of cell e.s.d.'s is used for estimating e.s.d.'s involving l.s. planes.

Refinement. The C1 methyl group is disordered over two positions.
