Edited by P. Dastidar, Indian Association for the Cultivation of Science, India

In the title compound,  $C_{29}H_{37}N_5O_4S_2$ , two arms substituted with dansyl derivatives are connected to a central tertiary amine, where the dihedral angle between the planes of two dansyl units is  $56.39(4)^\circ$ . Each arm contains a sulfonamide functional group and both N–H groups in the compound are pointed to the same side. The central part of the molecule is disordered over three sets of sites with a refined occupancy ratio of 0.547(4):0.328(4):0.125(3). No intramolecular  $\pi$ – $\pi$  or hydrogen-bonding interactions are observed. In the crystal, molecules are linked *via* pairs of N–H...O interactions involving the same acceptor atom, forming inversion dimers. In addition, C–H...O interactions exist between molecules, providing further stabilization of dimers.

**Keywords:** crystal structure; sulfonamide; dansyl derivative; hydrogen bonding.

**CCDC reference:** 1437206

## Crystal structure of 5,5'-bis(dimethylamino)-*N,N'*-(3-methyl-3-azapentane-1,5-diyl)di(naphthalene-1-sulfonamide)

Toyketa V. Horne, Syed A. Haque, Adrienne Barton and Md. Alamgir Hossain

### S1. Chemical context

Sulfonamide-based compounds are potential receptors for anions interacting *via* hydrogen bonding interactions under neutral conditions (Kavallieratos, *et al.* 2005). This class of compounds are also known to possess antibacterial activities and widely used as antibiotics (Brackett *et al.* 2004). Previous studies suggest that tweezer-type compounds are effective in binding a variety of anions in solution (Basaran, *et al.* 2015). As a part of our ongoing research on anion chemistry (Hossain, 2008), we have been interested in synthesizing sulfonamide-based neutral receptors. Herein, we report the crystal structure of the title compound, which is being studied in order to explore its ability to bind anions.

### S2. Structural commentary

The molecule adopts a bowl-like shape with the dihedral angle of 56.39 ° between the planes of two dansyl units. The hydrogen atoms of NH groups are positioned at the same side in the compound and are pointed inside the cavity formed by the NH—C—C—N—C—C—N chain of the central part (Fig. 1). The C—N and C—C bond lengths in the aliphatic groups are in the range of 1.451 (3) to 1.491 (5) Å and 1.484(10) to 1.539 (4) Å, respectively; which are consistent with the literature value (Basaran, *et al.* 2015). The central part of the molecule containing N1, C2A, C3A, C2B, C3B, and C21 is disordered and chemically-equivalent distances are set to be approximately the same. Displacement parameters of disordered atoms are set to be approximately the same along each chemical bond. The sum of the three occupancies is set to 1.0. Details of the specific restraints are available in the \*.cif. No intramolecular  $\pi$ – $\pi$  or hydrogen bonding interactions are observed. However, two molecules are linked *via* NH $\cdots$ O interactions [2.28 (2)–2.41 (2) Å] from two NH groups of one molecule with one oxygen group of other molecule (Fig. 2).

### S3. Synthesis and crystallization

2,2'-Diamino-*N*-methyldiethylamine (0.20 g, 1.71 mmol) and dansyl chloride (0.92 g, 3.43 mmol) were dissolved separately in 100 mL of CH<sub>3</sub>CN. The solution of dansyl chloride was added dropwise to the solution of 2,2'-diamino-*N*-methyldiethylamine containing K<sub>2</sub>CO<sub>3</sub> (1.0 g) in a round bottom flask under constant stirring at room temperature. The mixture was allowed to stir over night at room temperature and the clear solution was separated by filtration. The solvent was evaporated under reduced pressure, and the product was purified by column chromatography on neutral alumina using 2% methanol in dichloromethane. The greenish yellow powder thus obtained was redissolved in methanol and crystals suitable for X-ray analysis were grown from the slow evaporation of the solvent.

### S4. Refinement

Crystal data, data collection and structure refinement details are summarized in Table 1. H atoms on C were placed in idealized positions with C—H distances 0.95 - 0.99 Å and thereafter treated as riding. The coordinates of those on N

were refined.  $U_{\text{iso}}$  for H was assigned as 1.2 times  $U_{\text{eq}}$  of the attached atom (1.5 for methyl). A torsional parameter was refined for each methyl group. The largest residual density peak was 1.50 Å from O2.

**Figure 1**

Special details

**Geometry.** All e.s.d.'s (except the e.s.d. in the dihedral angle between two l.s. planes) are estimated using the full covariance matrix. The cell e.s.d.'s are taken into account individually in the estimation of e.s.d.'s in distances, angles and torsion angles; correlations between e.s.d.'s in cell parameters are only used when they are defined by crystal symmetry. An approximate (isotropic) treatment of cell e.s.d.'s is used for estimating e.s.d.'s involving l.s. planes.
