In the molecule of title compound, C₁₅H₂₀O₆, also known as cynarinin A, the cyclopentane ring having twist conformation and a γ -lactone ring assuming an envelope conformation are trans- and cis-fused, respectively, to a cycloheptane ring adopting a twist-chair conformation. In the crystal, $O-H \cdots O$ hydrogen bonds link neighbouring molecules, forming a three-dimensional network. Theoretical calculations of the molecular structure using the CNDO approximation and MOPAC PM3 geometry optimization are in satisfactory agreement with the results of the X-ray structure analysis.

1. Chemical context

The genus Centaurea belongs to the asteraceae family and consists of more than seven hundred species throughout the world. One hundred and ninety species are found in Turkey, one hundred of which are endemic (Davis et al., 1988). Centaurea species contain acetylenic compounds (Christensen & Lam, 1990), flavonoids (Gulcemal et al., 2010; Kubacey et al., 2012; Khalfallah et al., 2012; Forgo et al., 2012) and sesquiterpene lactones (Bruno et al., 1996; Koukoulitsa et al., 2002; Janackovic et al., 2004; Bensouici et al., 2012), and display anticancer (Chicca et al., 2011; Csapi et al., 2010), antimicrobial, and anti-oxidant activities (Uysal et al., 2013; Politeo et al., 2012; Djeddi et al., 2011). Sesquiterpene lactones (SLs) are a class of plant secondary metabolites of lipophilic character. SLs exhibit diverse biological activities such as antiinflammatory, anti-ulcer, antibacterial, antiviral, antifungal, and cytotoxic activity, and have an influence on the central nervous system and cardiovascular system (Yeşilada et al., 1995). As a contribution to this research field, the X-ray crystal structure of the title compound, also known as cynarinin A (Kamanzi et al., 1983), is reported herein.

2. Structural commentary

The title compound contains a cyclopentane ring and a γ -lactone ring *trans*- and *cis*-fused, respectively, to a cycloheptane ring (Fig. 1). The relative configurations at the asymmetric centres are C1(S), C4(R), C5(R), C6(R), C7(R), C8(R) and C10(S). The cyclopentane ring (C4/C5/C10–C12) is in a twist conformation about the C4–C5 bond with puckering parameters Q = 0.340 (3) Å and $\varphi = 21.3$ (4)°. The γ -lactone ring (O1/C6–C9) has an envelope conformation, with C7 at the flap [puckering parameters: Q = 0.271 (2) Å, $\varphi = 259.0$ (5)°]. The cycloheptane ring has a twist-chair conformation.

Table 1				
Hydrogen-bond	geometry	(Å,	°).	

$D - H \cdots A$	$D-\mathrm{H}$	$H \cdot \cdot \cdot A$	$D \cdots A$	$D - H \cdots A$
$O3-H3O\cdots O2^{i}$	0.78 (5)	2.06 (4)	2.818 (3)	168 (4)
$O4-H4O\cdots O3^{ii}$	0.95 (5)	2.14 (5)	2.956 (3)	144 (4)
$O4-H4O\cdots O5^{ii}$	0.95 (5)	2.45 (5)	3.156 (3)	132 (4)
O5−H5 <i>O</i> ···O6	0.90 (4)	2.45 (4)	2.877 (3)	109 (3)
$O5-H5O\cdots O2^{iii}$	0.90 (4)	2.22 (4)	3.096 (2)	164 (4)

Symmetry codes: (i) $-x + \frac{3}{2}, -y + 1, z - \frac{1}{2}$; (ii) $-x + 1, y - \frac{1}{2}, -z + \frac{3}{2}$; (iii) $-x + \frac{1}{2}, -y + 1, z - \frac{1}{2}$.

mation [puckering parameters: $Q^2 = 0.534 (2) \text{ Å}$, $\varphi^2 = 34.5 (3)^\circ$; $Q^3 = 0.650 (2) \text{ Å}$, $\varphi^3 = 191.5 (2)^\circ$ and $Q_T = 0.841 (2) \text{ Å}$]. The pseudo-diad axis bisects the C1–C2 bond and passes through atom C5. All bond lengths and angles are unexceptional and comparable with those reported for a similar compound (Swamy *et al.*, 2005).

3. Supramolecular features

In the crystal, neighbouring molecules are connected by $O-H\cdots O$ hydrogen bonds (Table 1; Fig. 2), forming a three dimensional network.

4. Theoretical calculations

According to the results of a quantum mechanical calculation using the *CNDO* approximation (Pople *et al.*, 1970), the charges at atoms O1, O2, O3, O4, O5 and O6 are -0.270, -0.241, -0.261, -0.255, -0.243 and -0.268 e⁻, respectively. The total energy and dipole moment of the title molecule are -6339.85 eV and 3.211 Debye. The HOMO and LUMO

Figure 2

The crystal packing of the title compound, viewed down the b axis, showing the three-dimensional hydrogen-bonding network (dashed lines).

Figure 3 Spatial view of the molecule of the title compound calculated using the *PM3* method

energy levels are -12.5301 and 3.7741 eV, respectively. In addition, a geometrical optimization calculation of the title compound was performed using *MOPAC PM3* (Stewart, 1985). The spatial disposition of the atoms of the title molecule calculated with *PM3* is shown in Fig. 3. The net charges at atoms O1, O2, O3, O4, O5 and O6 are -0.225, -0.304, -0.340, -0.318, -0.287 and $-0.307e^-$, respectively. The total energy and dipole moment of the title molecule are -3848.31 eV and 3.305 Debye. The HOMO and LUMO energy levels are -10.3738 and 0.5350 eV, respectively. In the calculations, the molecule was assumed to be isolated and in an absolute vacuum therefore resulting in calculated bond lengths, bond angles and torsion angles that are greater than those observed experimentally. The *PM3* method gives the lowest values for the HOMO and LUMO energy levels and the dipole moment.

5. Synthesis and crystallization

Centaurea polypodiifolia Boiss. (1.0 kg) was extracted with methanol $(3 \times 5L)$, filtered, and the solvent removed in vacuo to obtain the crude material which was dissolved in water (333 K) and extracted with ethyl acetate. The organic phase was separated by separator funnel and the solvent was removed by reduced pressure to yield the extract (10 g). The extract was subjected to silica gel (60, GF₂₅₄) column chromatography (2.5 cm \times 60 cm). A hexane/ethyl acetate mixture (6:4 v/v) was used as eluent. 24 fractions of 250 mL were collected. After checking by thin layer chromatography, 6-8 fractions were combined and crystallized in methanol to give suitable crystals of the title compound on slow evaporation of the solvent (yield: 10 mg). 13 C NMR (150 MHz, DMSO- d_6) δ 219.04 (C3), 178.88 (C12), 145.62 (C10), 113.64 (C14), 81.65 (C6), 78.36 (C11), 69.19 (C8), 63.68 (C13), 55.76 (C7), 51.31 (C5), 48.58 (C9), 46.91 (C4), 43.23 (C2), 39.66 (C1), 14.83

6. Refinement

Crystal data, data collection and structure refinement details are summarized in Table 2. H atoms bound to oxygen atoms were found in a difference Fourier map and allowed to ride on their parent atoms, with O-H = 0.82 Å and with $U_{\rm iso} = 1.5$ $U_{\rm eq}({\rm O})$. H atoms bound to carbon atoms were placed in idealized positions and allowed to ride on their parent atoms, with C-H = 0.93–0.98 Å, and with $U_{\rm iso} = 1.2 U_{\rm eq}({\rm C})$. One outlier (1 0 1) was omitted in the last cycles of refinement.

Special details

Geometry. Bond distances, angles *etc*. have been calculated using the rounded fractional coordinates. All su's are estimated from the variances of the (full) variance-covariance matrix. The cell e.s.d.'s are taken into account in the estimation of distances, angles and torsion angles

Refinement. Refinement on F^2 for ALL reflections except those flagged by the user for potential systematic errors. Weighted *R*-factors *wR* and all goodnesses of fit *S* are based on F^2 , conventional *R*-factors *R* are based on *F*, with *F* set to zero for negative F^2 . The observed criterion of $F^2 > \sigma(F^2)$ is used only for calculating *-R*-factor-obs *etc.* and is not relevant to the choice of reflections for refinement. *R*-factors based on F^2 are statistically about twice as large as those based on *F*, and *R*-factors based on ALL data will be even larger.
