Treatment of $N, N$-bis(pyridin-4-ylmethyl)cyclohexane-1,4-diamine with hydrochloric acid in ethanol led to the formation of the title salt, $\mathrm{C}_{18} \mathrm{H}_{26} \mathrm{~N}_{4}{ }^{2+} \cdot 2 \mathrm{Cl}^{-} \cdot 2 \mathrm{H}_{2} \mathrm{O}$, which lies about a crystallographic inversion center at the center of the cyclohexyl ring. The asymmetric unit therefore comprises one half of the $N, N$-bis(pyridin-4-ylmethyl)cyclohexane-1,4-diammonium dication, a chloride anion, and a solvent water molecule. In the dication, the two trans-(4pyridine) $-\mathrm{CH}_{2}-\mathrm{NH}_{2}$ - moieties occupy equatorial sites at the 1 - and 4 -positions of the central cyclohexyl ring, which is in a chair conformation. The terminal pyridine ring is tilted by $27.98(5)^{\circ}$ with respect to the mean plane of the central cyclohexyl moiety (r.m.s. deviation $=0.2379 \AA$ ). In the crystal, dications, anions, and solvent water molecules are connected via $\mathrm{N} / \mathrm{C} / \mathrm{O}-\mathrm{H} \cdots \mathrm{Cl}$ and $\mathrm{N}-\mathrm{H} \cdots \mathrm{O}$ hydrogen bonds together with $\mathrm{C}-\mathrm{H} \cdots \pi$ interactions, forming a threedimensional network.

## 1. Chemical context

An enormous number of metal-organic frameworks (MOFs) have been developed over the last two decades because of their attractive topologies and their desirable applications in a wide range of fields (Silva et al., 2015; Furukawa et al., 2014). For the development of these MOFs, many chemists have designed and prepared various dipyridyl-type ligands (Robin \& Fromm, 2006; Robson, 2008; Leong \& Vittal, 2011). Our group has also focused on the search for extended dipyridyltype ligands with a bulky central section for the development of MOFs with intriguing topologies or useful properties. As a part of our ongoing efforts, we prepared just such a dipyridyltype ligand with a central cyclohexyl moiety, namely $N, N-$ bis(pyridin-4-ylmethyl)cyclohexane-1,4-diamine, synthesized by a condensation reaction between 1,4-cyclohexanediamine and 4-pyridinecarboxaldehyde according to a literature procedure (Huh \& Lee, 2007). Herein we report on the crystal structure of the title salt obtained by the protonation of both amine groups in this molecule.

Figure 1
A view of the molecular structure of the title salt with the atomnumbering scheme. Displacement ellipsoids are drawn at the $50 \%$ probability level and yellow dashed lines represent the intermolecular $\mathrm{N}-\mathrm{H} \cdots \mathrm{O}$ and $\mathrm{N}-\mathrm{H} \cdots \mathrm{Cl}$ hydrogen bonds. [Symmetry code: (i) $-x+1$, $-y+1,-z+2$.]

## 2. Structural commentary

The asymmetric unit of the centrosymmetric title salt, $\mathrm{C}_{18} \mathrm{H}_{26} \mathrm{~N}_{4}{ }^{2+} 2 \mathrm{Cl}^{-} \cdot 2 \mathrm{H}_{2} \mathrm{O}$, comprises one half of $\mathrm{N}, \mathrm{N}$-bis(pyridin-4-ylmethyl)cyclohexane-1,4-diammonium dication, a chloride anion and a solvent water molecule (Fig. 1) due to the crystallographic inversion center located at the center of the cyclohexyl ring. The central cyclohexyl moiety of the dication adopts a chair conformation. The two trans-(4-pyridine)- $\mathrm{CH}_{2}-$ $\mathrm{NH}_{2}-$ moieties at the 1- and 4-positions of the central cyclohexyl ring occupy equatorial positions. The terminal pyridine ring is tilted by $27.98(5)^{\circ}$ with respect to the mean plane through the central cyclohexyl moiety (r.m.s. deviation $=$ $0.2379 \AA$ ). The distance between the two terminal pyridine nitrogen atoms in the dication is $15.864(2) \AA$. This is slightly shorter than the $\mathrm{N} \cdots \mathrm{N}$ separation $[15.970$ (3) $\AA$ A in the dication ligand of a one-dimensional zigzag-like $\mathrm{Co}^{\mathrm{II}}$ coordination

Figure 2
The two-dimensional undulating layer formed through intermolecular $\mathrm{C}-\mathrm{H} \cdots \pi$ interactions (light-blue dashed lines) and $\mathrm{N}-\mathrm{H} \cdots \mathrm{O} / \mathrm{Cl}$ and $\mathrm{C}-\mathrm{H} \cdots \mathrm{Cl}$ hydrogen bonds (yellow dashed lines). H atoms not involved in intermolecular interactions have been omitted for clarity.

Table 1
Hydrogen-bond geometry ( $\AA,^{\circ}$ ).
$C g 1$ is the centroid of the $\mathrm{N} 2 / \mathrm{C} 5-\mathrm{C} 9$ ring.

$x+1, y, z$; (v) $x,-y+\frac{1}{2}, z+\frac{1}{2}$.
polymer built up from alternate $\mathrm{Co}^{\mathrm{II}}$ ions and the dication of the title salt (Lee \& Lee, 2010).

## 3. Supramolecular features

In the crystal, adjacent dications are linked by weak $\mathrm{C}-\mathrm{H} \cdots \pi$ interactions, Table 1 (light-blue dashed lines in Figs. 2 and 3), resulting in the formation of a two-dimensional undulating layer-like structure extending parallel to the $b c$ plane. The undulating layer is further stabilized by $\mathrm{N}-\mathrm{H} \cdots \mathrm{O} / \mathrm{Cl}$ and $\mathrm{C}-$

Figure 3
The three-dimensional supramolecular network formed through intermolecular $\mathrm{N}-\mathrm{H} \cdots \mathrm{O}$ hydrogen bonds (black dashed lines). Intermolecular $\mathrm{C}-\mathrm{H} \cdots \pi$ interactions, and $\mathrm{N}-\mathrm{H} \cdots \mathrm{O} / \mathrm{Cl}$ and $\mathrm{C}-\mathrm{H} \cdots \mathrm{Cl}$ hydrogen bonds within the two-dimensional undulating layer are shown as light-blue and yellow dashed lines, respectively. H atoms not involved in intermolecular interactions have been omitted for clarity.
$\mathrm{H} \cdots \mathrm{Cl}$ hydrogen bonds (yellow dashed lines in Fig. 2) between the dications and the solvent water molecules/ chloride anions, respectively. Furthermore, neighboring undulating layers are connected through $\mathrm{O}-\mathrm{H} \cdots \mathrm{N}$ hydrogen bonds (black dashed lines in Fig. 3) between the solvent water molecules and the pyridine nitrogen atoms, forming a threedimensional supramolecular network. In addition, $\mathrm{O}-\mathrm{H} \cdots \mathrm{Cl}$ hydrogen bonds (Fig. 1 and Table 1) between the solvent water molecules and the chloride anions are also found in the crystal.

## 4. Synthesis and crystallization

$2 M$ hydrochloric acid in ethanol was added to an ethanol solution of $N, N$-bis(pyridin-4-ylmethylene)cyclohexane-1,4diamine, synthesized according to a literature method (Huh \& Lee, 2007), until $\mathrm{pH}=4-5$. The resulting mixture was left to evaporate slowly over several days, resulting in the formation of X-ray quality single crystals of the title salt.

## 5. Refinement

Crystal data, data collection and structure refinement details are summarized in Table 2. All C-bound H atoms were positioned geometrically with $d(\mathrm{C}-\mathrm{H})=0.95 \AA$ for $\mathrm{Csp}^{2}-\mathrm{H}$, $0.99 \AA$ for methylene, $1.00 \AA$ for methine H atoms, and were refined as riding with $U_{\text {iso }}(\mathrm{H})=1.2 U_{\text {eq }}(\mathrm{C})$. The N - and O bound H atoms involved in hydrogen bonding were located in difference Fourier maps and refined freely $[\mathrm{N}-\mathrm{H}=0.878$ (18) and 0.952 (17) $\AA ; \mathrm{O}-\mathrm{H}=0.78$ (2) and 0.86 (2) $\AA$ ( $]$.

## Special details

Geometry. All esds (except the esd in the dihedral angle between two l.s. planes) are estimated using the full covariance matrix. The cell esds are taken into account individually in the estimation of esds in distances, angles and torsion angles; correlations between esds in cell parameters are only used when they are defined by crystal symmetry. An approximate (isotropic) treatment of cell esds is used for estimating esds involving l.s. planes.
