1,2-Dimethyl-5-nitroimidazole (dimetridazole, dimet) is a compound that belongs to a class of nitroimidazole drugs that are effective at inhibiting the activity of certain parasites and bacteria. However, there are few reports that describe structures of compounds that feature metals complexed by dimet. Therefore, we report here that dimet reacts with $\mathrm{CuCl}_{2} \cdot \mathrm{H}_{2} \mathrm{O}$ to yield a chloridebridged copper(II) dimer, $\left[\mathrm{Cu}_{2} \mathrm{Cl}_{4}\left(\mathrm{C}_{5} \mathrm{H}_{7} \mathrm{~N}_{3} \mathrm{O}_{2}\right)_{4}\right]$ or $\left[\mathrm{Cu}(\mu-\mathrm{Cl}) \mathrm{Cl}(\text { dimet })_{2}\right]_{2}$. In this molecule, the $\mathrm{Cu}^{\mathrm{II}}$ ions are coordinated in an approximately trigonalbipyramidal manner, and the molecule lies across an inversion center. The dihedral angle between the imidazole rings in the asymmetric unit is 4.28 (7) ${ }^{\circ}$. Compared to metronidazole, dimetridazole lacks the hydroxyethyl group, and thus cannot form intermolecular $\mathrm{O} \cdots \mathrm{H}$ hydrogen-bonding interactions. Instead, $\left[\mathrm{Cu}(\mu-\mathrm{Cl}) \mathrm{Cl}(\text { dimet })_{2}\right]_{2}$ exhibits weak intermolecular interactions between the hydrogen atoms of $\mathrm{C}-\mathrm{H}$ groups and (i) oxygen in the nitro groups, and (ii) the terminal and bridging chloride ligands. The unit cell contains four disordered acetonitrile molecules. These were modeled as providing a diffuse contribution to the overall scattering by SQUEEZE [Spek (2015). Acta Cryst. C71, 9-18], which identified two voids, each with a volume of $163 \AA^{3}$ and a count of 46 electrons, indicative of a total of four acetonitrile molecules. These acetonitrile molecules are included in the chemical formula to give the expected calculated density and $F(000)$.

## 1. Chemical context

1,2-Dimethyl-5-nitroimidazole, also known as dimetridazole (dimet), is structurally related to metronidazole [2-(2-methyl-5-nitro-1H-imidazol-1-yl)ethanol, MET]. Thus, both compounds contain a 2-methyl-5-nitroimidazole core and are only differentiated according to whether one of the nitrogen atoms possesses a methyl substituent (as in dimet) or a hydroxyethyl substituent (as in MET), as illustrated in Fig. 1. Both MET and dimet are used to treat microbial infections,

(a)

(b)

Figure 1
A comparison of the structures of (a) metronidazole (MET) and (b) dimetridazole (dimet).
but dimet has specifically been used in animals for the treatment of, for instance, bovine trichomoniasis (McLoughlin, 1968), giardiasis in birds (Panigrahy et al., 1978) and swine dysentery (Messier et al., 1990). In order to control outbreaks of infection, a previous common practice was to incorporate dimet as a feed additive given, for example, to poultry and pigs (Buizer \& Severijnen, 1975). However, concerns about the mutagenic properties displayed by this class of drug (Voogd et al., 1974), and the fact that trace amounts can be detected in certain animal products intended for human consumption (Arias et al., 2016), have led to a discontinuation of this practice (EC bans use of dimetridazole in food animals, 1995). Reports of structures of metal compounds involving the coordination by dimetridazole are scarce. Herein, we describe the structure of the copper compound $\left[\mathrm{Cu}(\mu-\mathrm{Cl}) \mathrm{Cl}(\text { dimet })_{2}\right]_{2}$, which is obtained by the reaction of dimet with $\mathrm{CuCl}_{2} \cdot \mathrm{H}_{2} \mathrm{O}$ (see Scheme).

## 2. Structural commentary

Crystals of composition $\left[\mathrm{Cu}(\mu-\mathrm{Cl}) \mathrm{Cl}(\text { dimet })_{2}\right]_{2}$ were obtained by addition of dimet to $\mathrm{CuCl}_{2} \cdot 2 \mathrm{H}_{2} \mathrm{O}$ in chloroform, followed by recrystallization of the blue precipitate from acetonitrile. The molecular structure, as illustrated in Fig. 2, shows a centrosymmetric chlorido-bridged dimer. The coordination geometry around each copper atom is a slightly distorted trigonal-bipyramidal with two axial dimet ligands, and three chlorine ligands in the equatorial plane, two of which bridge to the adjacent copper. This structure is analogous to a previously reported copper(II) dimer containing MET, instead of dimet, $\left[\mathrm{Cu}(\mathrm{MET})_{2}(\mu-\mathrm{Cl}) \mathrm{Cl}\right]_{2}$ (Barba-Behrens et al., 1991), and a comparison of the two structures is shown in Fig. 3. Other recent examples of metal compounds containing MET include: $\mathrm{Cu}(\mathrm{MET})_{2} \mathrm{Cl}_{2}, \quad\left[\mathrm{Ag}(\mathrm{MET})_{2}\right]\left(\mathrm{BF}_{4}\right), \quad$ and $[\mathrm{H}(\mathrm{MET})]\left[\mathrm{AuCl}_{4}\right]$ (Palmer et al., 2015; Palmer \& Upmacis, 2015; Quinlivan et al., 2015).

Examination of the structure of the $\left[\mathrm{Cu}(\mu-\mathrm{Cl}) \mathrm{Cl}(\text { dimet })_{2}\right]_{2}$ complex demonstrates that, interestingly, the chlorine atoms bridge in an asymmetric manner, with $\mathrm{Cu}-\mathrm{Cl}_{\text {bridge }}$ bond lengths of 2.3811 (3) and 2.6024 (3) $\AA$, both of which are longer than the terminal $\mathrm{Cu}-\mathrm{Cl}$ bond length of 2.2822 (3) $\AA$. Of note, these features are also observed for the MET analog,

Figure 2
The molecular structure of $\left[\mathrm{Cu}(\mu-\mathrm{Cl}) \mathrm{Cl}(\text { dimet })_{2}\right]_{2}$, with displacement ellipsoids depicted at the $30 \%$ probability level. H atoms associated with methyl groups are not shown [symmetry code ('): $-x,-y+1,-z+1$ ].
$\left[\mathrm{Cu}(\mathrm{MET})_{2}(\mu-\mathrm{Cl}) \mathrm{Cl}\right]_{2}$, which possesses bridging $\mathrm{Cu}-\mathrm{Cl}$ distances of 2.418 (1) and 2.619 (1) A, and a terminal bond length of 2.297 (2) A (Barba-Behrens et al., 1991). Furthermore, the $\mathrm{Cu}-\mathrm{N}$ bond lengths [2.0009 (10) and 1.9914 (9) $\AA$ ] are also similar to the $\mathrm{Cu}-\mathrm{N}$ bond lengths reported for the MET analog [2.002 (4) and 1.993 (4) $\AA$ ]. In terms of the bond angles, the $\mathrm{N}-\mathrm{Cu}-\mathrm{Cl}_{\text {term }}$ and $\mathrm{N}-\mathrm{Cu}-\mathrm{Cl}_{\text {bridge }}$ angles are all close to $90^{\circ}$ [ranging from $88.95(3)^{\circ}$ for $\mathrm{N} 13-\mathrm{Cu}-\mathrm{Cl} 1$ to

## 3. Supramolecular features

The crystal structure displays a number of weak intermolecular interactions between hydrogen atoms of CH groups and the more electronegative atoms on adjacent molecules, such as the oxygen atoms in the nitro groups of the dimet ligand and also the terminal and bridging chlorine atoms (see Table 1 and Fig. 4). In this regard, one of the oxygen atoms of the nitro group participates in intermolecular hydrogenbonding interactions with $\mathrm{CH}_{3}$ and CH groups of an adjacent molecule. For reference, intermolecular and intramolecular $\mathrm{C}-\mathrm{H} \cdots \mathrm{O}$ hydrogen bonds involving an O atom from a nitro group (or other O-containing groups) have been reported (Desiraju, 1991; Sharma \& Desiraju, 1994; Forlani, 2009). As an illustration, intermolecular $\mathrm{C}-\mathrm{H} \cdots \mathrm{O}$ interactions (involving $\mathrm{C}-\mathrm{H}$ motifs from an $\mathrm{NMe}_{2}$ substituent and the O atoms of a nitro group) are reported at $2.71(3) \AA$, with $\mathrm{C} \cdots \mathrm{O}$ distances of 3.658 (4) and 3.725 (4) $\AA$ (Sharma \& Desiraju, 1994). The results of our structure analysis are also comparable to the average values that have been reported for hydrogen-bonding interactions of $(\mathrm{N}, \mathrm{C}) \mathrm{Csp}^{2}-\mathrm{H}$ (2.48 and

Figure 4
Weak intermolecular hydrogen-bonding interactions (shown as dashed lines) for $\left[\mathrm{Cu}(\mu-\mathrm{Cl}) \mathrm{Cl}(\text { dimet })_{2}\right]_{2}$.
$3.47 \AA$ ) and $\mathrm{Csp} p^{3}-\mathrm{CH}_{3}$ ( 2.63 and $3.61 \AA$ ) groups with a water O atom (Steiner, 2002). For comparison, intramolecular $\mathrm{N}-$ $\mathrm{H} \cdots \mathrm{O}$ interactions to an O atom of a nitro substituent form shorter contacts, e.g. 1.927 (15) $\AA$ for $N$-(2-nitrophenyl)benzamide (Saeed \& Simpson, 2009) and $2.11 \AA$ for 2-iodoN -(2-nitrophenyl)benzamide (Wardell et al., 2005), which is in accord with the reports that $\mathrm{C}-\mathrm{H} \cdots \mathrm{O}$ bonds are weaker than $\mathrm{N}-\mathrm{H} \cdots \mathrm{O}$ bonds (Desiraju, 1991).

The bridging chlorine atoms also form weak intermolecular interactions with $\mathrm{CH}_{3}$ and CH groups of an adjacent molecule. In addition, the terminal chlorine atom participates in a hydrogen-bonding interaction with a $\mathrm{CH}_{3}$ group of an adjacent molecule.

While $\mathrm{C}-\mathrm{H} \cdots \mathrm{O}$ interactions are widely accepted (Desiraju, 1991), $\mathrm{C}-\mathrm{H} \cdots \mathrm{Cl}$ interactions are considered more controversial, but a survey of the literature reveals that they also represent a common phenomenon (Aakeröy et al., 1999). For example, hydrogen-bonding interactions of $s p^{2}(\mathrm{~N}, \mathrm{C}) \mathrm{C}-$ H with $\mathrm{Cl}^{-}$are reported at $2.64 \AA$ (Kovacs \& Varga, 2006). However, when Cl is bonded to a metal, the average C $\mathrm{H} \cdots \mathrm{Cl}-M$ hydrogen-bonding distance is $2.974 \AA$ (Thallapally \& Nangia, 2001).

Fig. 4 illustrates some of these intermolecular interactions. An important difference between this structure and the MET analog is that the dimet compound lacks the hydroxyethyl group, which is involved in classical intermolecular hydrogenbonding interactions for the MET derivative (Barba-Behrens et al., 1991).

## 4. Database survey

There is only one structurally characterized metal compound containing dimet listed in the Cambridge Database (CSD Version 5.37; Groom et al., 2016), namely, a mononuclear cobalt complex, $\left[\mathrm{Co}(\text { dimet })_{2} \mathrm{Cl}_{2}\right]$, in which the cobalt(II) atom is surrounded by two dimet and two chlorido ligands in a distorted tetrahedron (Rosu et al., 1997; Idešicová et al., 2012). The $\mathrm{Co}-\mathrm{N}$ distances are reported to be 2.228 (2) and 2.035 (4) Å (Rosu et al., 1997).

## 5. Synthesis and crystallization

$\mathrm{CuCl}_{2} \cdot \mathrm{H}_{2} \mathrm{O}(3 \mathrm{mg}, 0.018 \mathrm{mmol})$ was added to a solution of dimet ( $6 \mathrm{mg}, 0.043 \mathrm{mmol}$ ) in chloroform ( 0.7 mL ), resulting in the precipitation of a blue solid over the course of 1 h at room temperature. The blue solid was isolated by decantation and crystals of $\left[\mathrm{Cu}(\mu-\mathrm{Cl}) \mathrm{Cl}(\text { dimet })_{2}\right]_{2}$, suitable for X-ray diffraction, were obtained by slow evaporation from a solution in acetonitrile.

## 6. Refinement

Crystal data, data collection and structure refinement details are summarized in Table 2. Hydrogen atoms on carbon were placed in calculated positions $(\mathrm{C}-\mathrm{H}=0.95-1.00 \AA)$ and included as riding contributions with isotropic displacement parameters $U_{\text {iso }}(\mathrm{H})=1.2 U_{\mathrm{eq}}\left(\mathrm{Cs} p^{2}\right)$ or $1.5 U_{\mathrm{eq}}\left(\mathrm{Cs} p^{3}\right)$. The unit

## Special details

Geometry. All esds (except the esd in the dihedral angle between two l.s. planes) are estimated using the full covariance matrix. The cell esds are taken into account individually in the estimation of esds in distances, angles and torsion angles; correlations between esds in cell parameters are only used when they are defined by crystal symmetry. An approximate (isotropic) treatment of cell esds is used for estimating esds involving l.s. planes.

Hydrogen-bond geometry ( $\AA,{ }^{o}$ )

| $D — \mathrm{H} \cdots A$ | $D-\mathrm{H}$ | $\mathrm{H} \cdots A$ | $D \cdots A$ | $D-\mathrm{H} \cdots A$ |
| :--- | :--- | :--- | :--- | :--- |
| $\mathrm{C} 25 — \mathrm{H} 25 C \cdots \mathrm{O} 22^{\mathrm{iii}}$ | 0.98 | 2.39 | $3.2804(17)$ | 150 |
| $\mathrm{C} 15 — \mathrm{H} 15 B \cdots \mathrm{Cl} 2^{\mathrm{iii}}$ | 0.98 | 2.73 | $3.6737(13)$ | 163 |
| $\mathrm{C} 12 — \mathrm{H} 12 A \cdots \mathrm{O} 22^{\mathrm{iv}}$ | 0.95 | 2.51 | $3.4029(16)$ | 156 |
| $\mathrm{C} 22 — \mathrm{H} 22 A \cdots \mathrm{Cl} 2^{\mathrm{iv}}$ | 0.95 | 2.75 | $3.6828(12)$ | 167 |
| $\mathrm{C} 24 — \mathrm{H} 24 C \cdots \mathrm{Cl1}$ |  | 0.98 | 2.84 | $3.7555(13)$ |

Symmetry codes: (iii) $x, y+1, z$; (iv) $-x+1,-y,-z+1$; (v) $-x+1, y+1 / 2,-z+1 / 2$.
