# Crystal structure of (1S,2R)-2-hydroxy-1,2-di-phenylethan-1-aminium (S)-2-azaniumylbutanedioate monohydrate 

Isao Fujii*

School of Science, Tokai University, 4-1-1 Kitakaname, Hiratuka, Kanagawa 259-1292, Japan. *Correspondence e-mail: fujii@wing.ncc.u-tokai.ac.jp

The title diastereomeric salt, formed between 2-amino-1,2-diphenylethanol (ADE) and aspartic acid (ASP), $\mathrm{C}_{14} \mathrm{H}_{16} \mathrm{NO}^{+} \cdot \mathrm{C}_{4} \mathrm{H}_{6} \mathrm{NO}_{4}{ }^{-} \cdot \mathrm{H}_{2} \mathrm{O}$, crystallizes as a monohydrate. The 1,2-diphenylethyl group in the cation has a cis conformation, and the aspartic acid anion is in the zwitterionic form. In the crystal, the ASP anions are linked via $\mathrm{N}-\mathrm{H} \cdots \mathrm{O}$ hydrogen bonds to form a $2_{1}$ helix along the $b$ axis direction. The helices are linked by the ADE cations via $\mathrm{O}-\mathrm{H} \cdots \mathrm{O}$ and $\mathrm{N}-\mathrm{H} \cdots \mathrm{O}$ hydrogen bonds, forming layers parallel to the $b c$ plane. There are channels in the layers that are occupied by water molecules, which link to both the anions and cations via $\mathrm{O}_{\text {water }}-\mathrm{H} \cdots \mathrm{O}$ and $\mathrm{N}-\mathrm{H} \cdots \mathrm{O}_{\text {water }}$ hydrogen bonds. There are also $\mathrm{C}-\mathrm{H} \cdots \mathrm{O}$ and $\mathrm{C}-\mathrm{H} \cdots \pi$ interactions present within the layers.

## 1. Chemical context

The production of chiral compounds has great importance in the pharmaceutical industry, and diastereomeric salt separation is still widely applied in the process. A synthetic optical resolving agent, chiral 2-amino-1,2-diphenylethanol (ADE) (Read \& Steele, 1927), has been widely tried and used in diastereomeric salt-separation methods for chiral alcohols or organic acids. L-( $S$ )-aspartic acid (ASP) is a known neurotransmitter, and $\mathrm{D}-(R)$ - ASP is a non-essential amino acid, one of two D-amino acids commonly found in mammals. D-ASP has also attracted attention as residue in the antifungal bacitracin, while $N$-methyl-D-aspartic acid (NMDA) acts as a specific agonist at the NMDA receptor. D-amino acids are mainly resolved enzymatically with D-aminoacylase (EC 3.5.1.14) in industrial applications. The optical separation of ASP with cis-ADE was introduced without chemical modification. The crystal structure of the title molecular salt, formed between $\mathrm{L}-(S)$-ASP and $(1 R, 2 S)$-cis-ADE, is reported herein.

$\mathrm{H}_{2} \mathrm{O}$

## 2. Structural commentary

The molecular structures of the components of the title salt are shown in Fig. 1, and selected torsion angles are given in Table 1. It can be seen that the hydroxy and protonated amino groups of cis-ADE form a tweezer-like motif. The dihedral angle between the phenyl rings ( $A$ and $B$; Fig.1) is 48.71 (9) ${ }^{\circ}$ and the torsion angle $\mathrm{O} 1 A-\mathrm{C} 1 A-\mathrm{C} 2 A-\mathrm{N} 1 A$ is $-65.0(2)^{\circ}$. The hydroxy group adopts a gauche conformation [O1A$\left.\mathrm{C} 1 A-\mathrm{C} 2 A-\mathrm{C} 9 A=60.1(2)^{\circ}\right]$ with respect to phenyl ring $B$. Thus, the tweezer-like motif is twisted with respect to the phenyl groups. This arrangement is similar to that found in racemic cis-ADE (Fujii, 2015) and the diastereomeric salts formed with cis-enantiomers.

L-( $S$ )-ASP crystallizes as a deprotonated zwitterion. The succinate group adopts a cis conformation $[\mathrm{C} 1 B-\mathrm{C} 2 B-$ $\left.\mathrm{C} 3 B-\mathrm{C} 4 B=-53.0(2)^{\circ}\right]$, which is the motif commonly found in L-ASP salts; for example L-His•L-ASP monohydrate (Suresh \& Vijayan, 1987). The amino and residual carboxy groups have a slightly right-handed helical-shape; torsion angles $\mathrm{N} 1 B-\mathrm{C} 2 B-\mathrm{C} 3 B-\mathrm{C} 4 B$ and $\mathrm{C} 2 B-\mathrm{C} 3 B-\mathrm{C} 4 B-\mathrm{O} 3 B$ are 73.0 (2) and 1.4 (3) $)^{\circ}$, respectively.

Figure 1
A view of the molecular structure of $(1 S, 2 R)$-cis-ADE•(S)-ASP monohydrate, with the atom and ring labelling. Displacement ellipsoids are drawn at the $50 \%$ probability level. Dashed lines indicate the hydrogen bonds (see Table 2).

Table 2

## 3. Supramolecular features

In the crystal, the $(S)$-ASP anions correlated with crystallographic symmetry are linked via $\mathrm{N} 1 B-\mathrm{H} 1 B 3 \cdots \mathrm{O} 4 B^{\mathrm{ii}}$ [2.868 (2) $\AA$ ] hydrogen bonds into $C(6)$ chains to form a righthanded $2_{1}$-helix along the $b$-axis direction (Fig. 2 and Table 2). The helices are linked by the $(1 R, 2 S)$-cis-ADE cations via N $\mathrm{H} \cdots \mathrm{O}$ hydrogen bonds $[\mathrm{N} 1 A-\mathrm{H} 1 A 2 \cdots \mathrm{O} 1 B=2.862(2) \AA$ and $\mathrm{N} 1 A-\mathrm{H} 1 A 1 \cdots \mathrm{O} 4 B^{\mathrm{iii}}=2.742(3) \AA$ ] and $\mathrm{O}-\mathrm{H} \cdots \mathrm{O}$ hydrogen bonds $\left[\mathrm{O} 1 A-\mathrm{H} 1 O 1 \cdots \mathrm{O} 2 B^{\mathrm{i}}=2.752\right.$ (2) $\AA$ ], forming layers parallel to the $b c$ plane (Fig. 3, Table 2). There are channels in the layers that are occupied by water molecules which link to both the anions and cations via tetrahedrally placed hydrogen bonds; $\mathrm{O}_{\text {water }}-\mathrm{H} \cdots \mathrm{O}$ hydrogen bonds

Figure 2
A view along the $c$ axis of the right-handed $2_{1}$-helix of ASP anions. Hydrogen bonds are shown as dashed lines (see Table 2) and C-bound H atoms have been omitted.

Figure 3
A partial view along the $b$ axis of the crystal packing of the ASP helices linked by the ADE cations. Hydrogen bonds are shown as dashed lines (see Table 2) and C -bound H atoms have been omitted.
$\left[\mathrm{O} 1 C-\mathrm{H} 1 O B \cdots \mathrm{O} 1 B^{\mathrm{i}}=2.734(2) \AA\right.$ and $\mathrm{O} 1 C-$ $\mathrm{H} 1 O A \cdots \mathrm{O} 1 B^{\text {iv }}=2.840(2) \AA$ 이 $\mathrm{N}-\mathrm{H} \cdots \mathrm{O}_{\text {water }}$ hydrogen bonds $[\mathrm{N} 1 B-\mathrm{H} 1 B 2 \cdots \mathrm{O} 1 C=2.938(2) \AA$ and $\mathrm{N} 1 A-$

Figure 4
A view along the $b$ axis of the crystal packing of ( $1 S, 2 R$ )-cis-ADE•( $(S)$ ASP monohydrate. Hydrogen bonds are shown as dashed lines (see Table 2) and C-bound H atoms have been omitted.

Computer programs: CAD4 (Enraf-Nonius, 1994), XCAD4 (Harms \& Wocadlo, 1995), SHELXS86 (Sheldrick, 2008), SHELXL2017 (Sheldrick, 2015), ORTEP-3 for Windows and WinGX (Farrugia, 2012), Mercury (Macrae et al., 2008), PLATON (Spek, 2009) and publCIF (Westrip, 2010).
$\mathrm{H} 1 A 3 \cdots \mathrm{O} 1 C=2.926$ (3) Å], shown in Fig. 4; see also Table 2. There are also $\mathrm{C}-\mathrm{H} \cdots \mathrm{O}$ and $\mathrm{C}-\mathrm{H} \cdots \pi$ interactions present within the layers (Table 2). Finally, the hydrophobic and hydrophilic layers are well separated along the $a$-axis direction.

## 4. Database survey

The author has reported the crystal structures of several amino acids without chemical modification including the chiral resolving agents; $1,1^{\prime}$-binaphthalene- $2,2^{\prime}$-diyl hydrogen phosphate, 2-phenoxypropionic acid and mandelic acid (Fujii \& Hirayama, 2002; Fujii et al., 2005, 2006). The crystal structures of racemic trans- and cis-ADE have been reported (GAQXON: Bari et al., 2012; RUTROP: Fujii, 2015, respectively). Recently, the solvent-induced chirality switching in optical resolution between mandelic acid and cis-ADE has been demonstrated (Shitara et al., 2013). Moreover, a database search (CSD Version 5.28, last update May 2017; Groom et al., 2016) yielded other comparable structures, viz. L-aspartic acid (LASPRT: Derissen et al., 1968), L-aspartic acid monohydrate (IJEQET: Umadevi et al., 2003) and $N$-methyl-D-aspartic acid monohydrate (KEWGUO: Sawka-Dobrowolska et al., 1990).

## 5. Synthesis and crystallization

(1R,2S)-cis-2-Amino-1,2-diphenylethanol (ADE) and aspartic acid (ASP) were purchased from Sigma-Aldrich Co. Ltd. The title molecular salt was obtained from an aqueous ethanol solution of racemic-ASP and $(1 R, 2 S)$-cis-ADE in a $2: 1$ molar ratio, heated to 333 K under stirring. On slow cooling to ambient temperature and slow evaporation of the solvent, colourless rod-shaped crystals were obtained.

## 6. Refinement

Crystal data, data collection and structure refinement details are summarized in Table 3. All the H atoms were located in difference-Fourier maps. The $\mathrm{NH}_{3}{ }^{+}, \mathrm{OH}$, and water H atoms were freely refined. The C -bound H atoms were included in calculated positions and treated as riding atoms: $\mathrm{C}-\mathrm{H}=0.93-$ $0.98 \AA$ with $U_{\text {iso }}(\mathrm{H})=1.2 U_{\text {eq }}(\mathrm{C})$.

Absolute structure parameter: 0.1 (2)

## Special details

Geometry. All esds (except the esd in the dihedral angle between two l.s. planes) are estimated using the full covariance matrix. The cell esds are taken into account individually in the estimation of esds in distances, angles and torsion angles; correlations between esds in cell parameters are only used when they are defined by crystal symmetry. An approximate (isotropic) treatment of cell esds is used for estimating esds involving l.s. planes.

Hydrogen-bond geometry ( $A,{ }^{\circ}$ )
$C g B$ is the centroid of phenyl ring $B$ (C9-C14).
