In the title compound,  $C_{28}H_{34}N_2O_5$ , the adjacent ester and nitrobenzene substituents are connected *via* an intramolecular methylene- $C-H\cdots\pi$ (nitrobenzene) interaction and the molecule approximates to a U-shape. The dihydropyrrole ring (r.m.s. deviation = 0.003 Å) is almost co-planar with the carboxylate residue  $[C_m-N-C1-O_c (m = methine, c = carboxyl)$  torsion angle = 1.8 (4)°] but is orthogonal to the 4-methoxybenzene ring [dihedral angle = 84.34 (17)°]. In the crystal, methylene- $C-H\cdots O(carbonyl)$  interactions lead to linear supramolecular chains along the *b*-axis direction, which pack without directional interactions between them. The analysis of the calculated Hirshfeld surface points to the importance of weak interatomic  $H\cdots H$ ,  $O\cdots H/H\cdots O$  and  $C\cdots H/H\cdots C$  contacts in the crystal.

#### 1. Chemical context

The reaction of an unsaturated halide species with an alkene, in the presence of both a base and a organopalladium catalyst, to form a substituted alkene, is termed the Heck reaction (Heck, 1982; Crisp, 1998). As part of our investigations into the scope of the Heck reaction in the total, enantioselective and efficient synthesis of pyrrolidine alkaloids, such as the natural product (–)-codonopsinine (Severino & Correia, 2001), an enecarbamate containing the chiral auxiliary residue, 8-(4-nitrophenyl)menthol, was submitted to a Heck arylation reaction with 4-methoxyphenyldiazonium tetrafluoroborate. The reaction yielded the title compound, 8-(4-nitrophenyl)menthyl 2-(4-methoxyphenyl)pyrroline-3-carboxylate, (I), as the sole crystalline material (Machado, 2001). Herein, the crystal and molecular structures of (I) are described along with an analysis of the calculated Hirshfeld surfaces.

#### 2. Structural commentary

The molecular structure of (I), Fig. 1, comprises a 1-, 2- and 5substituted cyclohexyl ring (chair conformation) with the chirality at these equatorially substituted centres, *i.e.* C14, C15 and C18, established from the synthesis, being R, S and R, respectively. The dihydropyrrole ring is essentially planar, with an r.m.s. deviation of 0.003 Å for the five constituent

Table 1

$D - H \cdots A$	$D-\mathrm{H}$	$H \cdot \cdot \cdot A$	$D \cdots A$	$D - \mathbf{H} \cdot \cdot \cdot A$
$C5-H5A\cdots Cg1$ $C19-H19B\cdots O2^{i}$	0.97	2.67	3.612 (3)	163
	0.97	2.60	3.472 (4)	150

Symmetry code: (i) x, y - 1, z.

atoms: the N1 and C5 atoms lie 0.037(2) and 0.030(3) Å to opposite sides of the plane. The chirality of the C2 centre is R. The carboxylate residue is almost co-planar with the fivemembered pyrrole ring as seen in the value of the C2-N1-C13-O2 torsion angle of 1.8 (4)°. However, the appended 4-methoxybenzene ring is almost orthogonal to the pyrrole ring, forming a dihedral angle of 84.34 (17)°; the methoxy group is co-planar with the benzene ring with the C12-O3-C9-C10 torsion angle being 178.0 (4)°. In the same way, the nitro group is co-planar with the benzene ring to which it is connected with the O5-N2-C27-C28 torsion angle being  $1.2(5)^{\circ}$ . In the molecule, there is a close pyrrole-methylene-C5–H··· $\pi$ (C24–C29) interaction, Table 1, which connects the substituents at the cyclohexyl-C14 and C15 atoms which lie to the same side of the molecule and which define a shape corresponding to the letter U.

#### 3. Supramolecular features

The molecular packing of (I) features a number of weak noncovalent contacts as discussed below in the *Hirshfeld surface analysis* (§4). In accord with the distance criteria assumed in *PLATON* (Spek, 2009), there is only one directional interaction of note, Table 1. Thus, methylene-C19-H···· O2(carbonyl) interactions connect molecules into a linear supramolecular chain along the *b*-axis direction, Fig. 2*a*. These assemble in the crystal with no directional interactions between them, Fig. 2*b*.

#### 4. Hirshfeld surface analysis

The Hirshfeld surfaces calculated for (I) were conducted as reported recently for a related organic molecule (Zukerman-Schpector *et al.*, 2017) and provide information on the influence of short interatomic non-bonded contacts upon the molecular packing.

Figure 1

The molecular structure of (I), showing the atom-labelling scheme and displacement ellipsoids at the 35% probability level.

With reference to Fig. 3, in addition to the bright-red spots near the methylene-H19*B* and carbonyl-O2 atoms, representing the C-H···O interaction listed in Table 1, the diminutive-red spots near the O3, C9 and H17*B* atoms, corresponding to short interatomic O3···H17*B* and C9···H17*B* contacts (Table 2), on the Hirshfeld surface mapped over  $d_{norm}$  suggest they also have some influence on the molecular packing in the crystal. The effect of other short interatomic O···H/H····O and C···H/H····C contacts listed in

Molecular packing in (I): (a) view of the supramolecular chain along the b axis and (b) a view of the unit-cell contents shown in projection down the b axis. The C-H···O contacts are shown as orange dashed lines.

### research communications

Table 2 Summary of short interatomic contacts (Å) in (I).

Contact	Distance	Symmetry operation
H2· · · H5 <i>B</i>	2.31	x, 1 + y, z
H7···H5 <i>B</i>	2.28	x, 1 + y, z
H22A···H25	2.31	x, 1 + y, z
O3· · ·H17B	2.52	1 + x, 1 + y, z
O3···H20 <i>B</i>	2.56	$2-x, -\frac{1}{2}+y, 2-z$
O4···H4	2.56	$2-x, -\frac{1}{2}+y, 1-z$
O5···H22 <i>C</i>	2.60	$1-x, -\frac{1}{2}+y, 1-z$
C9···H17B	2.72	1 + x, 1 + y, z
C9···H12C	2.80	$2-x, -\frac{1}{2}+y, 2-z$
С23· · ·Н3	2.84	-1 + x, -1 + y, z

 Table 3

 Percentage contributions of interatomic contacts to the Hirshfeld surface for (I).

Contact	Percentage contribution
$H \cdots H$	61.7
$O \cdot \cdot \cdot H/H \cdot \cdot \cdot O$	23.9
$C \cdot \cdot \cdot H/H \cdot \cdot \cdot C$	12.3
$N \cdot \cdot \cdot H/H \cdot \cdot \cdot N$	1.1
00	0.7
$C \cdots O / O \cdots C$	0.2
$\mathbf{C} \cdots \mathbf{C}$	0.1

Table 2 are also viewed as faint-red spots near the O3, H4, O5 and H20*B* atoms in Fig. 3. The influence of the short interatomic O···H, C···H and H···H contacts in the molecular packing are also illustrated in Fig. 4*a* and *b*, which show the Hirshfeld surface mapped over the shape-index property and  $d_{\text{norm}}$ , respectively. The intramolecular C–H··· $\pi$  contact between the pyrrole-H5*A* atom and the nitrobenzene ring [H5*A*···*Cg*(C24–C29) = 2.67 Å, C5···*Cg*(C24–C29) = 3.612 (3) Å and C–H5*A*···*Cg*(C24–C29) angle = 163°] is shown as a black-dotted line within the Hirshfeld surfaces mapped over the electrostatic potential in Fig. 5.

The overall two-dimensional fingerprint plot for (I), Fig. 6a, and those delineated into  $H \cdots H$ ,  $O \cdots H/H \cdots O$  and  $C \cdots H/$ H...C contacts (McKinnon et al., 2007) are illustrated in Fig. 6b-d, respectively. The fingerprint plots also reflect the presence of the short interatomic contacts on the packing, Table 2. This is also evident from the percentage contribution from different interatomic contacts to the Hirshfeld surface summarized in Table 3: the  $H \cdots H$ ,  $O \cdots H/H \cdots O$  and  $C \cdots H/$ H...C interatomic contacts make the greatest contribution to the Hirshfeld surface and account for 97.9% of the overall surface. The broad feather-like distribution of points with a peak at  $d_{\rm e} + d_{\rm i} \sim 2.3$  Å in the fingerprint plot delineated into  $H \cdots H$  contacts in Fig. 5b represent  $H \cdots H$  contacts in the structure and make the greatest, i.e. 61.7%, contribution to the surface. The interatomic O···H/H···O contacts having a 23.9% contribution to the Hirshfeld surface arise from the C- $H \cdots O$  contact (Table 1) and short interatomic  $O \cdots H/H \cdots O$ 

Figure 3 Two views of the Hirshfeld surface for (I) mapped over  $d_{\text{norm}}$  in the range -0.071 to +1.718 au.

contacts (Table 2), and are viewed as the pair of green aligned points beginning at  $d_e + d_i \sim 2.6$  Å and a pair of jaw-shaped distribution of points in the range  $d_e + d_i \sim 2.5-2.6$  Å in Fig. 6c. The points distributed around the pair of forceps-like peaks at  $d_e + d_i \sim 2.8$  Å in the fingerprint plot delineated into  $C \cdots H/H \cdots C$  contacts (Fig. 6d) represent the formation of such intra-

Views of Hirshfeld surfaces mapped (a) with shape-index property highlighting short interatomic  $O \cdots H/H \cdots O$  and  $C \cdots H/H \cdots C$  contacts by red and sky-blue dashed lines, respectively, and (b) over  $d_{\text{norm}}$  showing intra-layer interatomic  $H \cdots H$  contacts by black dashed lines.

### research communications

Figure 5

A view of the Hirshfeld surface mapped over the electrostatic potential for (I) in the range -0.079 to +0.038 au, highlighting the intramolecular  $C-H\cdots\pi$  contact by a black dotted line. The red and blue regions represent negative and positive electrostatic potentials, respectively.

and inter-layer contacts in the crystal. The small contribution from other interatomic contacts summarized in Table 3 appear to have a negligible impact on the molecular packing.

Figure 6

#### 5. Database survey

The (1R, 2S, 5R)-menthyl substrate is important as a chiral source for the synthesis of natural products and, as such, has been found in a number of crystal structures related to (I). Owing to the dictates of the chirality at the C1 and C2 positions, a parallel alignment of the substituents at these positions usually result in U-shaped geometries (Aoyagi et al., 1998; Singh et al., 1990; Streith et al., 1995), except in circumstances where steric hindrance precludes such an arrangement (Comins & Killpack, 1992).

#### 6. Synthesis and crystallization

As detailed previously (Machado, 2001), for the Heck arylation of (1R,2S,5R)-5-methyl-2-[2-(4-nitrophenyl)propan-2yl]cyclohexyl 2,3-dihydro-1H-pyrrole-1-carboxylate, a stoichiometric quantity of 4-methoxyphenyldiazonium tetrafluoroborate was used along with 1 mol equivalent of Pd<sup>0</sup> and 400 mol equivalent of sodium acetate. The reaction was conducted in acetonitrile at room temperature for 15 min, yielding (1R,2S,5R)-5-methyl-2-[2-(4-nitrophenyl)propan-2-(2S)-2-(4-methoxyphenyl)-2,5-dihydro-1Hyl]cyclohexyl pyrrole-1-carboxylate and the title compound, (I), the latter being the only crystalline product, obtained as irregular

colourless chunks by slow evaporation of an *n*-hexane–ethyl acetate solution (8:2 v/v). M.p 378–380 K. ESI–MS (*m*/*z*) calculatedd for C<sub>28</sub>H<sub>34</sub>N<sub>2</sub>O<sub>5</sub> [*M*]<sup>+</sup> 478.24677, found 478.24676.  $[\alpha]_{D}^{20} = +85.6 \text{ gc} = 0.7$ ; ethylacetate).  $R_{\rm F} = 0.40$  (hexane–ethyl acetate, 8:2 v/v).

The reported <sup>1</sup>H and <sup>13</sup>C NMR reflect the presence of two conformational rotamers in solution. <sup>1</sup>H NMR (500 MHz, CCl<sub>4</sub>):  $\delta$  [8.01 (d, J = 9 Hz) + 7.94 (d, J = 9 Hz) = 2H]; [7.43 (d, J = 9 Hz) + 7.16 (d, J = 9 Hz) = 2H]; [7.05 (d, J = 9 Hz) + 7.00 (d, J = 9 Hz) = 2H]; [6.77 (d, J = 9 Hz) + 6.70 (d, J = 9 Hz) = 2H]; 5.88 ( $br \ d, J = 6$  Hz) + 5.67–5.59 (m) = 1H]; [5.67–5.59 (m) + 5.51 (dd, J = 7 Hz, 1 Hz) = 1H]; [5.27 ( $br \ s$ ) + 5.19 ( $br \ s$ ) = 1H]; 4.70 (td, J = 10 Hz and 5 Hz, 1H); [4.36 ( $br \ d, J = 15$  Hz) + 4.21 (m) + 3.53 (dd, J = 15 and 5Hz) + 2.59 (dd, J = 15 and 2 Hz) = 2H]; [3.77 (s) + 3.72 (s) = 3H]; 2.04–0.49 (m, 11H); [1.43 (s) + 1.25 (s) = 3H]; [1.21 (s) + 1.11 (s) = 3H]. <sup>13</sup>C NMR (75.5 MHz, CCl<sub>4</sub>):  $\delta$  159.1, 158.5, 151.6, 132.2, 130.9, 130.5, 128.0, 127.8, 125.9, 125.5, 123.9, 123.7, 122.3, 113.3, 113.1, 95.8, 73.5, 72.7, 67.3, 66.8, 54.6, 54.3, 51.7, 51.5, 42.4, 39.9, 34.3, 31.1, 30.2, 29.4, 26.0, 21.6, 21.5.

#### 7. Refinement details

Crystal data, data collection and structure refinement details are summarized in Table 4. The C-bound H atoms were placed in calculated positions (C-H = 0.93-0.98 Å) and were included in the refinement in the riding model approximation, with  $U_{iso}(H)$  set to 1.2-1.5 $U_{eq}(C)$ .

#### Special details

**Geometry**. All esds (except the esd in the dihedral angle between two l.s. planes) are estimated using the full covariance matrix. The cell esds are taken into account individually in the estimation of esds in distances, angles and torsion angles; correlations between esds in cell parameters are only used when they are defined by crystal symmetry. An approximate (isotropic) treatment of cell esds is used for estimating esds involving l.s. planes.

#### Hydrogen-bond geometry (Å, °)

Cg1 is the ring centroid of the C24–C29 ring.

	D—H	H···A	D···A	D—H…A
