The title hydrated salt, tris[hexaamminecobalt(III)] tetraoxidorhenate(VII) tetrakis[hexafluoridorhenate(IV)] hexahydrate, arose unexpectedly due to possible contamination of the K_2ReF_6 starting material with KReO_4 . It consists of octahedral $[\text{Co}(\text{NH}_3)_6]^{3+}$ cation (Co1 site symmetry 1), tetrahedral $[\text{Re}^{\text{VII}}\text{O}_4]^-$ anions (Re site symmetry 1) and octahedral $[\text{Re}^{\text{IV}}\text{F}_6]^{2-}$ anions (Re site symmetries 1 and $\bar{3}$). The $[\text{ReF}_6]^{2-}$ octahedral anions (mean Re–F = 1.834 Å), $[\text{Co}(\text{NH}_3)_6]^{3+}$ octahedral cations (mean Co–N = 1.962 Å), and the $[\text{ReO}_4]^-$ tetrahedral anion (mean Re–O = 1.719 Å) are slightly distorted. A network of N–H···F hydrogen bonds consolidates the structure. The crystal studied was refined as a two-component twin.

1. Chemical context

The chemistry of Re^{VII} is dominated by the tetrahedral perrhenate anion, $[\text{ReO}_4]^-$ (Latimer, 1952; Abram, 2003) while Re^{IV} is typically found in salts containing octahedral $[\text{ReX}_6]^{2-}$ ($X = \text{F}, \text{Cl}, \text{Br}, \text{I}$) anions (Berthold & Jakobson, 1964; Jorgensen & Schwochau, 1965; Grundy & Brown, 1970; Louis-Jean *et al.*, 2018). The salts of $[\text{ReX}_6]^{2-}$ ($X = \text{Cl}, \text{Br}, \text{I}$) can be prepared in high yield by the reduction of a perrhenate starting material in the corresponding concentrated HX acid (Briscoe *et al.*, 1931; Watt *et al.*, 1963). However, salts of $[\text{ReF}_6]^{2-}$ are typically prepared from the solid-state melting reaction of $[\text{ReX}_6]^{2-}$ ($X = \text{Cl}, \text{Br}, \text{I}$) with $A\text{HF}_2$ ($A = \text{NH}_4^+, \text{K}^+$) followed by an aqueous work-up (Ruff & Kwasnik, 1934; Louis-Jean *et al.*, 2018). Such a procedure is found to be challenging. Nonetheless, an improved procedure for the preparation of $A_2[\text{ReF}_6]$ ($A = \text{K}, \text{Rb}, \text{Cs}$) salts as well as their X-ray single-crystal structures was recently reported (Louis-Jean *et al.*, 2018).

In the process of exploring the coordination chemistry of hexafluororhenate(IV) compounds, the title compound (**I**), an unexpected mixed-valence rhenium(IV)–rhenium(VII) salt arose in an effort to prepare $[\text{Co}(\text{NH}_3)_6]_2[\text{ReF}_6]_3$ by metathesis from K_2ReF_6 and $\text{Co}(\text{NH}_3)_6\text{Cl}_3$ in water (353 K). Yellow–orange needle-like crystals of (**I**) were obtained within two hours by slow evaporation in water at room temperature.

**Figure 1**

The molecular structure of (I) (Fig. 1) is built up from a $[\text{Co}(\text{NH}_3)_6]^{3+}$ cation, three distinct $[\text{ReF}_6]^{2-}$ anions, one $[\text{ReO}_4]^-$ anion, and two water molecules of crystallization: these components are held together by electrostatic forces and hydrogen bonding. Site symmetries for the metal atoms are Co1: 1 (Wyckoff position 18*f*), Re1: 3 (Wyckoff position 6*c*), Re2: 1 (Wyckoff position 18*f*), Re3: 3 (Wyckoff position 3*a*), and Re4: 3 (Wyckoff position 3*b*).

The crystals of (I) are air stable over short periods, but decompose to a black material after six months of storage at ambient temperature.

2. Structural commentary

The structure of (I) (Fig. 1) is built up from a $[\text{Co}(\text{NH}_3)_6]^{3+}$ cation, three distinct $[\text{ReF}_6]^{2-}$ anions, one $[\text{ReO}_4]^-$ anion, and two water molecules of crystallization: these components are held together by electrostatic forces and hydrogen bonding. Site symmetries for the metal atoms are Co1: 1 (Wyckoff position 18*f*), Re1: 3 (Wyckoff position 6*c*), Re2: 1 (Wyckoff position 18*f*), Re3: 3 (Wyckoff position 3*a*), and Re4: 3 (Wyckoff position 3*b*).

position 18*f*), Re3: 3 (Wyckoff position 3*a*), and Re4: 3 (Wyckoff position 3*b*).

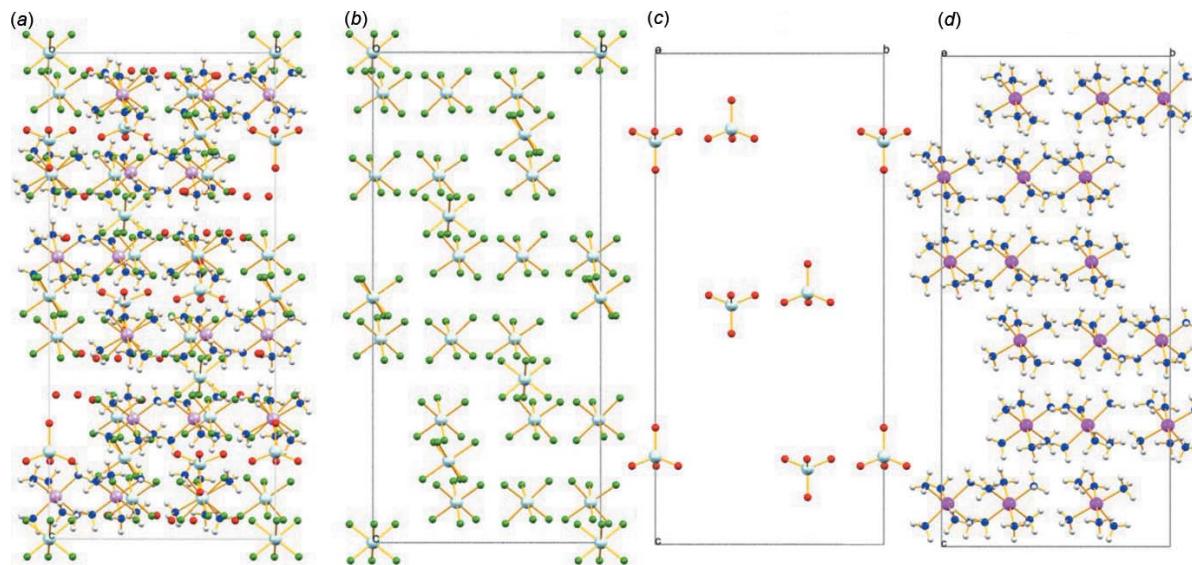

The octahedral $[\text{Co}(\text{NH}_3)_6]^{3+}$ cation in (I) is slightly distorted; the average Co–N bond length of 1.962 Å is in agreement with the average Co–N bond lengths of 1.963 Å in $[\text{Co}(\text{NH}_3)_6](\text{ReO}_4)\cdot 2\text{H}_2\text{O}$ (Baidina *et al.*, 2012) and 1.966 Å in $[\text{Co}(\text{NH}_3)_6](\text{TCO}_4)_3$ (Poineau *et al.*, 2017). In (I), the shortest Co···Co and N···N separations between nearby $[\text{Co}(\text{NH}_3)_6]^{3+}$ cations are 7.035 (1) and 4.473 (1) Å, respectively.

In the tetrahedral $[\text{ReO}_4]^-$ anion in (I), the average Re–O bond length (1.719 Å) is in agreement with the average Re–O bond length of 1.720 Å in $[\text{Co}(\text{NH}_3)_6](\text{ReO}_4)\cdot 2\text{H}_2\text{O}$ (Baidina *et al.*, 2012). In (I) the values of three Re–O bond lengths, $[\text{Re1–O2}^i, \text{Re1–O2}^{ii} = 1.715(8)$ Å; symmetry codes: (i) $1 - x + y, 1 - x, z$; (ii) $1 - y, x - y, z$] are slightly shorter than the fourth one [$\text{Re1–O1} = 1.748(14)$ Å]. In (I), all O–Re–O bond angles in the $[\text{ReO}_4]^-$ anion are 109.5 (3)°. However, in $[\text{Co}(\text{NH}_3)_6](\text{ReO}_4)\cdot 2\text{H}_2\text{O}$, the $[\text{ReO}_4]^-$ anion is slightly distorted by up to 2.7° (Baidina *et al.*, 2012).

The $[\text{ReF}_6]^{2-}$ anions are slightly distorted, with Re–F bond lengths varying from 1.916 (6) Å to 1.929 (6) Å. All the Re–F bond lengths in the Re3- and Re4-centred anions are of equal distances of 1.952 (6) and 1.950 (6) Å, respectively, by symmetry. Overall, the average Re–F bond length (1.834 Å) in (I) is notably shorter than the average Re–F bond length (1.951 Å) in $A_2[\text{ReF}_6]$ ($A = \text{K}, \text{Rb}, \text{Cs}$) salts previously studied (Louis-Jean *et al.*, 2018).

3. Supramolecular features

A perspective view of the unit-cell plots for (I) and its component ions ($[\text{ReF}_6]^{2-}$, $[\text{ReO}_4]^-$, and $[\text{Co}(\text{NH}_3)_6]^{3+}$) are shown in Fig. 2. In the supramolecular structure of the title

**Figure 2**

Unit-cell plots showing only (a) the complete structure of (I), (b) the $[\text{ReF}_6]^{2-}$ octahedra, (c) the $[\text{ReO}_4]^-$ tetrahedra and (d) the $[\text{Co}(\text{NH}_3)_6]^{3+}$ octahedra viewed along the crystallographic *b* axis. Color of atoms: Re aqua blue, F green, Co purple, N blue, O red, H gray.

4. Database survey

To the best of our knowledge, (I) is the only reported hexahalogenorhenate–perrhenate structure containing both rhenium(IV) and rhenium(VII). It is noted that K₂[ReF₆] used for the preparation of (I) was not characterized before use and the presence of perrhenate in (I) may be due to the presence of K[ReO₄] in the starting material. Efforts to isolate the technetium (Tc-99) derivative compound, [Co(NH₃)₆]₃[(Tc^(vii)O₄)₂(Tc^(iv)F₆)₄] are in progress.

5. Synthesis and crystallization

All chemicals were obtained commercially from Sigma Aldrich® and used without any further purification. The starting material, K₂[ReF₆], was prepared following the method described in our previous publication (Louis-Jean *et al.*, 2018).

K₂[ReF₆] (114 mg, 0.3 mmol) was dissolved in 2 ml of hot water (353 K), and [Co(NH₃)₆]Cl₃ (53.5 mg, 0.2 mmol) dissolved in 1 ml of H₂O was added. The solution was allowed to evaporate slowly at room temperature and yellow-orange needle-like crystals of (I) were obtained within two hours. The compound was washed with H₂O (3 × 1 ml), followed by isopropanol (3 × 1 ml) and then diethyl ether (3 × 1 ml). Single crystals of (I) were grown in H₂O by slow evaporation at room temperature. Yield: *ca* 91%. The presence of perrhenate in (I) is probably due to the presence of K[ReO₄] in the starting material (*i.e.* K₂ReF₆).

6. Refinement

Crystal data, data collection and structure refinement details are summarized in Table 2. The H atoms of the co-crystallized water molecules could not be located in the present experiment.

Special details

Geometry. All esds (except the esd in the dihedral angle between two l.s. planes) are estimated using the full covariance matrix. The cell esds are taken into account individually in the estimation of esds in distances, angles and torsion angles; correlations between esds in cell parameters are only used when they are defined by crystal symmetry. An approximate (isotropic) treatment of cell esds is used for estimating esds involving l.s. planes.

Refinement. Refined as a 2-component twin.
