The asymmetric unit of the title compound, C<sub>25</sub>H<sub>21</sub>N<sub>3</sub>O<sub>2</sub>S, comprises four molecules. Their conformations differ primarily in the orientations of the styryl and the *N*-phenylcarboxamido groups. In the crystal, intermolecular N—H···N, C—H···O and C—H···S hydrogen-bonding contacts as well as C—H··· $\pi$ (ring) interactions lead to the formation of a layer structure parallel to (010). Hirshfeld surface analysis revealed that H···H interactions represent the main contributions to the crystal packing.

## 1. Chemical context

Thienopyridine derivatives are well known to possess various functional and medicinal properties with general applications as synthetic building blocks or as pharmaceuticals (Litvinov *et al.*, 2005; Dotsenko *et al.*, 2020; Bakhite, 2003; Al-Waleedy *et al.*, 2020; Abuelhassan *et al.*, 2021). Many thienopyridines are reported to show anticancer (Zeng *et al.*, 2010), antiparasitic (Bernardino *et al.*, 2006), insecticidal (El-Dean *et al.*, 2019), antimicrobial (Abdel-Rahman *et al.*, 2003; Eldin, 1999) and antidiabetic (Bahekar *et al.*, 2007) activities. Encouraged by the above facts, we report in this communication the synthesis and crystal structure determination of the title compound, C<sub>25</sub>H<sub>21</sub>N<sub>3</sub>O<sub>2</sub>S (**1**).

## 2. Structural commentary

The asymmetric unit of (**1**) contains four molecules (Fig. 1) of which one (molecule **I**) is represented in an *ORTEP*-style plot

in Fig. 2. The conformational differences between molecules I, II, III and IV are highlighted in the overlay diagram shown in Fig. 3. The maximum r.m.s. deviation of the overlay between molecules I, II, III and IV is 0.498 Å. The conformations of the four molecules differ primarily in the varying orientations of the styryl and the *N*-phenylcarboxamido groups, as indicated by the torsion and dihedral angles collated in Tables 1 and 2. The orientations of the latter substituents are partially deter-

mined by the intramolecular N–H···O hydrogen bond (Table 3 and Fig. 2). In each molecule, both the thiophene and pyridine rings are planar to within 0.0235 (11) Å (maximum r.m.s. deviation = 0.0163 Å) and 0.0197 (12) Å (maximum r.m.s. deviation = 0.0125 Å). Other bond lengths and angles are all in the expected ranges.

### 3. Supramolecular features

In the crystal, various hydrogen-bonding interactions are found (Table 3). The strongest stem from interactions between the amide NH group and the pyridine N atom of a neighbouring molecule (N3–H3A···N4<sup>i</sup>, N6–H6D···N7<sup>ii</sup>, N9–H9A···N10<sup>v</sup> and N12–H12A···N1<sup>vi</sup>). Weaker C33–H33C···O8<sup>iii</sup> and C75–H75···S4<sup>v</sup> interactions between a methyl group and an a carbonyl O atom, and between a phenyl CH group and a thiophene S atom, respectively, consolidate

#### 4. Hirshfeld surface analysis

For the four molecules I, II, III and IV, intermolecular interactions (Table 4) were quantified using Hirshfeld surface analysis and the associated two-dimensional fingerprint plots generated. The calculations and visualization were carried out using *Crystal Explorer 17.5* (Turner *et al.*, 2017). Fig. 6 shows the Hirshfeld surface of the four molecules in (I) mapped over *d*<sub>norm</sub> in a fixed colour scale of –0.3297 (red) to +1.5167 (blue)

contributions. The percentage contributions of other weak interactions are listed in Table 5.

The fact that the same interactions result in different contributions to the Hirshfeld surface for molecules I, II, III and IV can be attributed to the different environments of each molecule in the crystalline state.

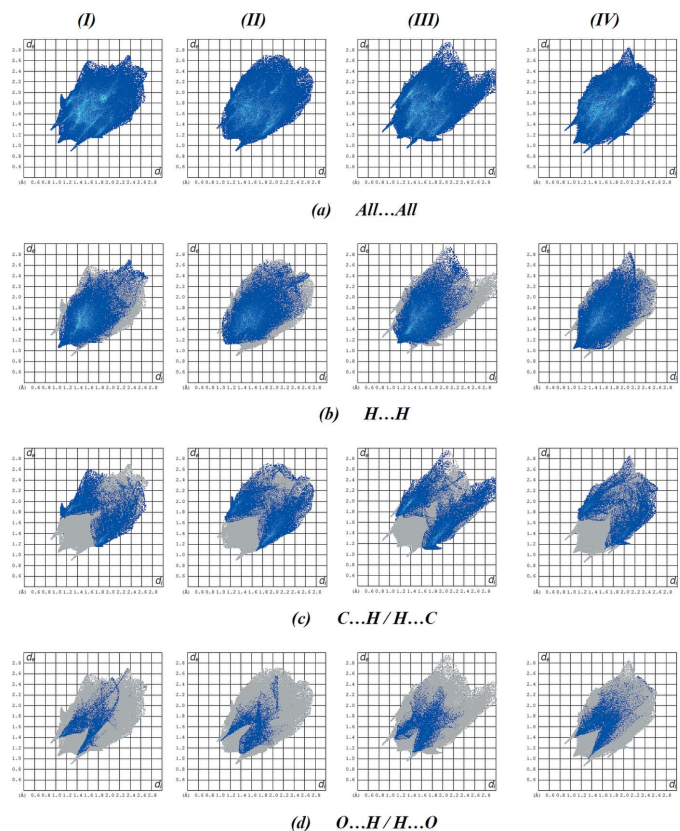

### 5. Database survey

A search of the Cambridge Structural Database (CSD Version 5.41, update of November 2019; Groom *et al.*, 2016) for the thieno[2,3-*b*]pyridine moiety yielded ten structures closely related to the title compound: ethyl 3-amino-6-methyl-2-[(4-methylphenyl)carbamoyl]-4-[(*E*)-2-phenylethenyl]thieno[2,3-*b*]pyridine-5-carboxylate hydrate (TACXED; Mague *et al.*, 2016a), diethyl 3-amino-6-methyl-4-[(*E*)-2-phenylethenyl]-

[2,3-*b*]pyridine-5-carboxylate (ULAROQ; Bakhite *et al.*, 2016b), ethyl 3-(4-methylbenzenesulfonamido)thieno[2,3-*b*]pyridine-2-carboxylate (GOLDUH; Zhang *et al.*, 2009), ethyl 3-aminothieno[2,3-*b*]pyridine-2-carboxylate (QOLPEN; Zheng *et al.*, 2009), 4-(4-bromophenyl)-2,5-bis(ethoxycarbonyl)-6-methylthieno[2,3-*b*]pyridine (WUVZES; Novoa de Armas *et al.*, 2003), 5-acetyl-3-amino-4-(4-methoxyphenyl)-6-methylthieno[2,3-*b*]pyridine-2-carbonitrile (NEQSUA; Mohamed *et al.*, 2017) and 2-amino-6-benzyl-3-(ethoxycarbonyl)-4,5,6,7-tetrahydrothieno[2,3-*c*]pyridin-6-ium (hydrogen bis(4-methoxyphenyl)diphosphonate) (RUTRUV; Mague *et al.*, 2015).

In the crystal of TACXED, mutual N—H···O hydrogen bonds form dimers, which are then associated into chains parallel to the *c* axis through O—H···N hydrogen bonds involving the solvent water molecule. In the crystal of MUZXOW, the bicyclic core of the compound is slightly folded [1.9 (1)°], while pairwise intermolecular N—H···O hydrogen bonding forms dimers across centres of symmetry. In the crystal of XEBPIF, an intramolecular N—H···O<sub>carbonyl</sub> hydrogen bond closes an *S*(6) ring. Supramolecular chains along [011̄] mediated by O—H···N(pyridine) hydrogen bonds form in the crystal. A three-dimensional network is completed by  $\pi$ – $\pi$  interactions occurring between the benzene ring and the two rings of the thieno[2,3-*b*]pyridine unit. In the crystal of AWETIH, molecules are linked by pairs of N—H···O hydrogen bonds, forming inversion dimers with an  $R_2^2(8)$  ring motif. Within the dimers, which stack along the *a*-axis direction, there is a weak  $\pi$ – $\pi$  interaction involving inversion-related thiophene rings. In the crystal of ULAROQ, the conformation of the title molecule is partially determined by an intramolecular N—H···O hydrogen bond, forming an *S*(6) loop, and an N—H··· $\pi$  interaction involving the centroid of the 4-chlorophenyl ring. In the crystal, molecules are linked by pairs of N—H···O hydrogen bonds, forming inversion dimers with an  $R_2^2(20)$  ring motif. In the crystal of GOLDUH, the amino and carbonyl groups are nearly coplanar with the heterocyclic ring system. There are two N—H···O hydrogen-bonding interactions involving the same N—H donor set and two different acceptors, one in an intramolecular bond helping to fix the molecular conformation and the other defining a dimeric structure around the symmetry centre at (0,  $\frac{1}{2}$ ,  $\frac{1}{2}$ ). In the crystal of QOLPEN, molecules are linked into a zigzag sheet propagating along the *b*-axis direction by intermolecular N—H···O and N—H···N hydrogen bonds. WUVZES crystallizes with two molecules in the asymmetric unit. The crystal structure is stabilized by intermolecular and intramolecular C—H···O hydrogen bonds. The asymmetric unit of NEQSUA likewise comprises two molecules, which differ primarily in the orientations of the acetyl and *p*-anisyl substituents. In the crystal, N—H···O hydrogen bonds form chains extending parallel to (110). The asymmetric unit of the molecular salt RUTRUV comprises two cations and two anions. Each cation features an intramolecular N—H···O hydrogen bond, which closes an *S*(6) ring; in each case the hydroxyridine ring adopts a half-chair conformation. In the crystal, O—H···O and N—H···O hydrogen bonds link the components into [100] chains.

## 7. Refinement details

Crystal data, data collection and structure refinement details are summarized in Table 6. H atoms attached to carbon were placed in calculated positions ( $C-H = 0.95-0.98 \text{ \AA}$ ) while those attached to nitrogen were derived from a difference-Fourier map and their parameters adjusted to give  $N-H = 0.91 \text{ \AA}$ . All H atoms were included as riding contributions with isotropic displacement parameters 1.2–1.5 times those of the attached atoms.

### Special details

**Geometry.** All esds (except the esd in the dihedral angle between two l.s. planes) are estimated using the full covariance matrix. The cell esds are taken into account individually in the estimation of esds in distances, angles and torsion angles; correlations between esds in cell parameters are only used when they are defined by crystal symmetry. An approximate (isotropic) treatment of cell esds is used for estimating esds involving l.s. planes.

**Refinement.** Refinement of  $F^2$  against ALL reflections. The weighted R-factor wR and goodness of fit S are based on  $F^2$ , conventional R-factors R are based on F, with F set to zero for negative  $F^2$ . The threshold expression of  $F^2 > 2\sigma(F^2)$  is used only for calculating R-factors(gt) etc. and is not relevant to the choice of reflections for refinement. R-factors based on  $F^2$  are statistically about twice as large as those based on F, and R-factors based on ALL data will be even larger. H-atoms attached to carbon were placed in calculated positions (C—H = 0.95 - 0.98 Å) while those attached to nitrogen were placed in locations derived from a difference map and their parameters adjusted to give N—H = 0.91 Å. All were included as riding contributions with isotropic displacement parameters 1.2 - 1.5 times those of the attached atoms.

### Hydrogen-bond geometry ( $\text{\AA}$ , $^\circ$ )

Cg8, Cg14 and Cg18 are the centroids of the C36–C41, C70–C75 and C86–C91 benzene rings, respectively.
