The quinoxaline moiety in the title molecule, $\mathrm{C}_{13} \mathrm{H}_{13} \mathrm{ClN}_{2} \mathrm{O}_{3}$, is almost planar (r.m.s. deviation of the fitted atoms $=0.033 \AA$ ). In the crystal, $\mathrm{C}-\mathrm{H} \cdots \mathrm{O}$ hydrogen bonds plus slipped $\pi$-stacking and $\mathrm{C}-\mathrm{H} \cdots \pi$ (ring) interactions generate chains of molecules extending along the $b$-axis direction. The chains are connected by additional $\mathrm{C}-\mathrm{H} \cdots \mathrm{O}$ hydrogen bonds. Hirshfeld surface analysis indicates that the most important contributions to the crystal packing are from $\mathrm{H} \cdots \mathrm{H}(37.6 \%), \mathrm{H} \cdots \mathrm{O} / \mathrm{O} \cdots \mathrm{H}(22.7 \%)$ and $\mathrm{H} \cdots \mathrm{Cl} / \mathrm{Cl} \cdots \mathrm{H}(13.1 \%)$ interactions.

## 1. Chemical context

Nitrogen-based structures have attracted more attention in recent years because of their interesting properties in structural and inorganic chemistry (Faraj et al., 2022; Chkirate et al., 2022a,b, 2023; Al Ati et al., 2024). The family of quinoxalines, particularly those containing the 2-oxoquinoxaline moiety, is important in medicinal chemistry because of their wide range of pharmacological applications such as antibacterial activity (Chkirate et al., 2022c) and as potential anticancer agents (Abad et al., 2023). In particular, 3-methyl-2-oxoquinoxaline is a cytotoxic (Missioui et al., 2022a) and anticonvulsant agent (Ibrahim et al., 2013) and has anti-COVID-19 and antiAlzheimer's disease (Missioui et al., 2022b) activities. Given the wide range of therapeutic applications for such compounds, and in a continuation of the work already carried out on the synthesis of compounds from 2-oxoquinoxaline, a similar approach gave the title compound, ethyl 2-(7-chloro-3-methyl-2-oxoquinoxaline-1(2H)-yl)acetate $\mathrm{C}_{13} \mathrm{H}_{13} \mathrm{ClN}_{2} \mathrm{O}_{3}$ (I). Besides the synthesis, we also report the molecular and crystalline structures along with a Hirshfeld surface analysis.

Figure 1
The title molecule with labeling scheme and $50 \%$ probability ellipsoids.

## 2. Structural commentary

The quinoxaline moiety is almost planar (r.m.s. deviation of the fitted atoms $=0.033 \AA$ ) with largest deviations being observed for atom C8 [0.072 (5) $\AA$ ] to one side and atom N2 $[-0.072(5) \AA]$ on the other side of the mean plane. The dihedral angle between the mean planes of the two sixmembered rings making up the quinoxaline moiety is $2.1(2)^{\circ}$. The ester group is rotated well out of the plane of the quinoxaline moiety, as indicated by the $\mathrm{C} 8-\mathrm{N} 2-\mathrm{C} 10-\mathrm{C} 11$ torsion angle of $-88.2(5)^{\circ}$ (Fig. 1).

## 3. Supramolecular features

In the crystal, $\mathrm{C} 2-\mathrm{H} 2 \cdots \mathrm{O} 2$ and $\mathrm{C} 10-\mathrm{H} 10 A \cdots \mathrm{O} 2$ hydrogen bonds reinforced by $\mathrm{C} 9-\mathrm{H} 9 A \cdots C g 1$ interactions (Table 1) and slipped $\pi$-stacking interactions between the C1/C6/N1/C7/ $\mathrm{C} 8 / \mathrm{N} 2$ and $\mathrm{C} 1-\mathrm{C} 6$ rings [centroid-centroid distance $=$

Figure 2
A portion of one chain viewed along the $a$-axis direction with $\mathrm{C}-\mathrm{H} \cdots \mathrm{O}$ hydrogen bonds and $\mathrm{C}-\mathrm{H} \cdots \pi$ (ring) interactions depicted, respectively, by black and light blue dashed lines. Slipped $\pi$-stacking interactions are depicted by orange dashed lines and non-interacting hydrogen atoms are omitted for clarity.

Table 1
Hydrogen-bond geometry ( $\AA,^{\circ}$ ).
$C g 1$ is the centroid of the $\mathrm{C} 1 / \mathrm{C} 6 / \mathrm{N} 1 / \mathrm{C} 7 / \mathrm{C} 8 / \mathrm{N} 2$ ring.

| $D-\mathrm{H} \cdots A$ | D-H | H $\cdots A$ | $D \cdots A$ | $D-\mathrm{H} \cdots \cdot$ |
| :---: | :---: | :---: | :---: | :---: |
| $\mathrm{C} 2-\mathrm{H} 2 \cdots \mathrm{O} 2^{\mathrm{i}}$ | 0.95 | 2.39 | 3.211 (6) | 145 |
| C9-H9A $\cdots$ Cg1 ${ }^{\text {ii }}$ | 0.98 | 2.73 | 3.591 (6) | 147 |
| $\mathrm{C} 10-\mathrm{H} 10 \mathrm{~A} \cdots \mathrm{O} 2^{\text {i }}$ | 0.99 | 2.59 | 3.535 (7) | 159 |
| $\mathrm{C} 12-\mathrm{H} 12 A \cdots \mathrm{O} 1^{\text {iii }}$ | 0.99 | 2.49 | 3.471 (9) | 170 |
| $\mathrm{C} 13-\mathrm{H} 13 A \cdots \mathrm{O} 1^{\text {iv }}$ | 0.98 | 2.49 | 3.427 (7) | 160 |

Symmetry codes: (i) $x, y-1, z$; (ii) $x, y+1, z$; (iii) $-x+1,-y+2, z-\frac{1}{2}$; (iv) $-x+1,-y+1, z-\frac{1}{2}$.
$3.756(3)$ Å, dihedral angle $=2.1(2)^{\circ}$, slippage $=1.39 \AA$ lead to the formation of chains of molecules extending along the $b$ axis direction (Fig. 2). The chains are connected by $\mathrm{C} 12-\mathrm{H} 12 A \cdots \mathrm{O} 1$ and $\mathrm{C} 13-\mathrm{H} 13 A \cdots \mathrm{O} 1$ hydrogen bonds (Table 1), which form the full three-dimensional structure (Fig. 3).

## 4. Hirshfeld surface analysis

CrystalExplorer (Turner et al., 2017) was used to investigate and visualize the intermolecular interactions of (I). The Hirshfeld surface plotted over $d_{\text {norm }}$ in the range -0.2466 to 1.0065 a.u. is shown in Fig. 4a. The electrostatic potential using the STO-3G basis set at the Hartree-Fock level of theory and mapped on the Hirshfeld surface over the range $\pm 0.05$ a.u. clearly shows the positions of close intermolecular contacts in the compound (Fig. 4b). The positive electrostatic potential (blue region) over the surface indicates hydrogen-donor potential, whereas the hydrogen-bond acceptors are represented by negative electrostatic potential (red region). In the standard $d_{\text {norm }}$ surface (Fig. 5), the $\mathrm{C}-\mathrm{H} \cdots \mathrm{O}$ hydrogen bonds to the closest neighboring molecules are depicted by green dashed lines.

The overall two-dimensional fingerprint plot (McKinnon et al., 2007) is shown in Fig. 6a, while those delineated into

Figure 3
Packing viewed along the $c$-axis direction with $\mathrm{C}-\mathrm{H} \cdots \mathrm{O}$ hydrogen bonds and $\mathrm{C}-\mathrm{H} \cdots \pi$ (ring) interactions depicted, respectively, by black and light-blue dashed lines. Non-interacting hydrogen atoms and $\pi$-stacking interactions are omitted for clarity.

Figure 5

$\mathrm{H} \cdots \mathrm{H}, \mathrm{H} \cdots \mathrm{O} / \mathrm{O} \cdots \mathrm{H}, \mathrm{H} \cdots \mathrm{Cl} / \mathrm{Cl} \cdots \mathrm{H}, \mathrm{H} \cdots \mathrm{C} / \mathrm{C} \cdots \mathrm{H}, \mathrm{H} \cdots \mathrm{N} /$ $\mathrm{N} \cdots \mathrm{H}, \mathrm{C} \cdots \mathrm{C}, \mathrm{Cl} \cdots \mathrm{C} / \mathrm{C} \cdots \mathrm{Cl}$ and $\mathrm{N} \cdots \mathrm{C} / \mathrm{C} \cdots \mathrm{N}$ contacts are illustrated in Fig. 6b-i, respectively, together with their relative

Figure 4
(a) View of the three-dimensional Hirshfeld surface of the title compound, plotted over $d_{\text {norm }}$ and (b) view of the three-dimensional Hirshfeld surface of the title compound plotted over electrostatic potential energy using the STO-3 G basis set at the Hartree-Fock level of theory.

Figure 6
The full two-dimensional fingerprint plots for the title compound, showing (a) all interactions, and delineated into (b) $\mathrm{H} \cdots \mathrm{H},(c) \mathrm{H} \cdots \mathrm{O} /$ $\mathrm{O} \cdots \mathrm{H},(d) \mathrm{H} \cdots \mathrm{Cl} / \mathrm{Cl} \cdots \mathrm{H},(e) \mathrm{H} \cdots \mathrm{C} / \mathrm{C} \cdots \mathrm{H},(f) \mathrm{H} \cdots \mathrm{N} / \mathrm{N} \cdots \mathrm{H},(g) \mathrm{C} \cdots \mathrm{C}$, (h) $\mathrm{Cl} \cdots \mathrm{C} / \mathrm{C} \cdots \mathrm{Cl}$ and (i) $\mathrm{N} \cdots \mathrm{C} / \mathrm{C} \cdots \mathrm{N}$ interactions. The $d_{i}$ and $d_{e}$ values are the closest internal and external distances (in $\AA$ ) from given points on the Hirshfeld surface.
contributions to the Hirshfeld surface (HS). The most important interaction is $\mathrm{H} \cdots \mathrm{H}$, contributing $37.6 \%$ to the overall crystal packing, which is reflected in Fig. $6 b$ as widely scattered points of high density due to the large hydrogen content of the molecule, with the tip at $d_{\mathrm{e}}=d_{\mathrm{i}}=1.16 \AA$. The $\mathrm{H} \cdots \mathrm{O} / \mathrm{O} \cdots \mathrm{H}$ interactions shown by the pair of characteristic wings in the fingerprint plot delineated into these contacts ( $22.7 \%$ contribution to the HS), Fig. $6 c$, has the tips at $d_{\mathrm{e}}+d_{\mathrm{i}}=$ $2.25 \AA$. The pair of scattered points of spikes in the fingerprint plot delineated into $\mathrm{H} \cdots \mathrm{Cl} / \mathrm{Cl} \cdots \mathrm{H}$, Fig. $6 d$ (13.1\%), have the tips at $d_{\mathrm{e}}+d_{\mathrm{i}}=2.84 \AA$. The $\mathrm{H} \cdots \mathrm{C} / \mathrm{C} \cdots \mathrm{H}$ contacts, Fig. $6 e$ $(9.6 \%)$, have the tips at $d_{\mathrm{e}}+d_{\mathrm{i}}=2.94 \AA$. The $\mathrm{H} \cdots \mathrm{N} / \mathrm{N} \cdots \mathrm{H}$ contacts, Fig. $6 f$, contribute $4.9 \%$ to the HS and appear as a pair of scattered points of spikes with the tips at $d_{\mathrm{e}}+d_{\mathrm{i}}=$ 2.53 Å. The C $\cdots$ C contacts, Fig. $6 g(4 \%)$, have the tips at $d_{\mathrm{e}}+$ $d_{\mathrm{i}}=3.46 \AA$. Finally, the $\mathrm{Cl} \cdots \mathrm{C} / \mathrm{C} \cdots \mathrm{Cl}$ and $\mathrm{N} \cdots \mathrm{C} / \mathrm{C} \cdots \mathrm{N}$ contacts, Fig. $6 h-i$, contribute only $3.4 \%$ and $2.5 \%$, respectively, to the HS and have a low-density distribution of points.

## 5. Database survey

A search of the Cambridge Structural Database (CSD version 5.42, updated May 2021; Groom et al., 2016) with the 2-(3-methyl-2-oxoquinoxalin-1 2 H )-yl)acetyl fragment yielded multiple matches. Of these, two had a substituent on C11 comparable to (I) (Fig. 7). The first compound (II) (refcode DEZJAW; Missioui et al., 2018) carries a hydroxyl group on C11, while the second one (III) (refcode UGAMEY; Missioui et al., 2023) carries a $p$-tolylazane substituent. The acetic acid

Figure 7
Structures similar to (I): (II) (CSD refcode DEZJAW) and (III) (CSD refcode UGAMEY) obtained during the database search. The search fragment is indicated in blue.
part in DEZJAW forms a dihedral angle of $-93.62(11)^{\circ}$ with 3-methyl-2-oxoquinoxaline unit. In UGAMEY, the dihedral angles between the mean planes of the $N$-( $p$-tolyl)acetylamide (two positions with occupancies $0.50: 0.50$ ) and 3-methyl-2oxoquinoxaline rings are 104.1 (2) and $-71.0(2)^{\circ}$. As previously mentioned, the ethyl acetate group in (I) is also almost perpendicular to the 3-methyl-2-oxoquinoxaline unit [dihedral angle of $-88.2(5)^{\circ}$ ], which is approximately the same as in DEZJAW, and in between the two values in UGAMEY.

## 6. Synthesis and crystallization

$1.00 \mathrm{~g}(6.24 \mathrm{mmol})$ of 7-chloro-3-methylquinoxalin-2(1H)-one was dissolved in 25 mL of dimethylformamide and 1.15 g $(6.24 \mathrm{mmol})$ of ethyl 2-chloroacetate were added, followed by $1.0 \mathrm{~g}(7.5 \mathrm{mmol})$ of potassium bicarbonate, and a spatula tip of BTBA (benzyltributylammonium chloride) was used as a phase-transfer catalyst. The reaction was stirred for 2 h under reflux at 353 K . When the starting reagents had completely reacted, 500 mL of distilled water were added and a few minutes later the product precipitated. This was filtered off, dried and recrystallized from hot ethanol solution to yield light-yellow plate-like crystals of the title compound. ${ }^{1} \mathrm{H}$ NMR $\left(300 \mathrm{MHz}, \mathrm{CDCl}_{3}\right) \delta \mathrm{ppm}: 1.21\left(t, 3 \mathrm{H}, \mathrm{CH}_{3}, J=6 \mathrm{~Hz}\right) ; 2.07(s$, $\left.3 \mathrm{H}, \mathrm{CH}_{3}\right) ; 4.16$ (quin, $2 \mathrm{H}, \mathrm{CH}_{2}$ ); $4.59\left(s, 2 \mathrm{H}, \mathrm{CH}_{2}\right) ; 7.18-7.87$ $\left(m, 3 \mathrm{H}, \mathrm{CH}_{\text {arom }}\right) .{ }^{13} \mathrm{C}$ NMR ( $75 \mathrm{MHz}, \mathrm{CDCl}_{3}$ ) $\delta \mathrm{ppm}: 14.1$ $\left(\mathrm{CH}_{3}\right) ; 21.3\left(\mathrm{CH}_{3}\right) ; 51.6\left(\mathrm{CH}_{2}\right) ; 61.0\left(\mathrm{CH}_{2}\right) ; 123.3-125.7$ $\left(\mathrm{CH}_{\text {arom }}\right) ; 131.2-155.6\left(\mathrm{C}_{\mathrm{q}}\right) ; 155.7(\mathrm{C}=\mathrm{O}) ; 167.6(\mathrm{C}=\mathrm{O})$.

## 7. Refinement

Crystal data, data collection and structure refinement details are summarized in Table 2. The structure was refined as an inversion twin. Hydrogen atoms were were included as riding contributions in idealized positions and refined isotropically.

## Funding information

The support of NSF-MRI grant No. 1228232 for the purchase of the diffractometer and Tulane University for support of the Tulane Crystallography Laboratory are gratefully acknowledged.

$\Delta \rho_{\text {min }}=-0.32$ e $\AA^{-3}$
Absolute structure: Refined as an inversion twin
Absolute structure parameter: 0.17 (4)

## Special details

Experimental. The diffraction data were obtained from 16 sets of frames, each of width $0.5^{\circ}$ in $\omega$ or $\varphi$, collected with scan parameters determined by the "strategy" routine in APEX4. The scan time was $\theta$-dependent and ranged from 5 to 15 $\mathrm{sec} /$ frame.
Geometry. All esds (except the esd in the dihedral angle between two l.s. planes) are estimated using the full covariance matrix. The cell esds are taken into account individually in the estimation of esds in distances, angles and torsion angles; correlations between esds in cell parameters are only used when they are defined by crystal symmetry. An approximate (isotropic) treatment of cell esds is used for estimating esds involving l.s. planes.
Refinement. Refinement of $\mathrm{F}^{2}$ against ALL reflections. The weighted R -factor wR and goodness of fit S are based on $\mathrm{F}^{2}$, conventional $R$-factors $R$ are based on $F$, with $F$ set to zero for negative $F^{2}$. The threshold expression of $F^{2}>2 \operatorname{sigma}\left(\mathrm{~F}^{2}\right)$ is used only for calculating R -factors(gt) etc. and is not relevant to the choice of reflections for refinement. R-factors based on $\mathrm{F}^{2}$ are statistically about twice as large as those based on F , and R - factors based on ALL data will be even larger. H -atoms attached to carbon were placed in calculated positions ( $\mathrm{C}-\mathrm{H}=0.95-0.98 \AA$ ). All were included as riding contributions with isotropic displacement parameters 1.2-1.5 times those of the attached atoms. Refined as a 2 component inversion twin.

Fractional atomic coordinates and isotropic or equivalent isotropic displacement parameters $\left(A^{2}\right)$

## supporting information

Hydrogen-bond geometry (A, ${ }^{\circ}$ )
$C g 1$ is the centroid of the $\mathrm{C} 1 / \mathrm{C} 6 / \mathrm{N} 1 / \mathrm{C} 7 / \mathrm{C} 8 / \mathrm{N} 2$ ring.

| $D — \mathrm{H} \cdots A$ | $D-\mathrm{H}$ | $\mathrm{H} \cdots A$ | $D \cdots A$ | $D-\mathrm{H} \cdots A$ |
