The molecular structure of the title complex,  $[\text{Ni}(\text{C}_{13}\text{H}_8\text{F}_2\text{N}_2\text{O})(\text{C}_{14}\text{H}_{32}\text{P}_2)]$  or  $\text{Ni}(\text{oFPU})(\text{dippe})$ , where oFPU is the dianion of bis(2-fluorophenyl)urea and dippe is 1,2-bis(di-isopropylphosphino)ethane, comprises an  $\text{Ni}^{II}$  atom with a distorted square-planar coordination environment (geometry index  $\tau_4 = 0.195$ ). One of the fluorophenyl rings of the oFPU ligand is disordered over two sets of sites in an 0.832 (7):0.168 (7) ratio. The crystal structure displays  $\text{C}-\text{H}\cdots\text{O}$  and  $\text{C}-\text{H}\cdots\text{F}$  hydrogen-bonding interactions, leading to chains with  $R_2^2(12)$  motifs extending parallel to [100]. The title compound might be of interest with respect to the production of urea and carbamate derivatives of nickel(II).

## Structure description

Isocyanates are compounds that contain the functional group  $-\text{N}=\text{C}=\text{O}$  and can be prepared in different ways, from rearrangements on a laboratory scale to the phosphogenation of primary amines (Saunders & Slocombe, 1948) used in industry. The importance of isocyanates is demonstrated by the multitude of reactions in which they can be either used directly or serve as reaction intermediates. For example, isocyanates are employed in the production of urea and carbamate derivatives, which find agrochemical and/or pharmaceutical applications (Braunstein & Nobel, 1989). In this context, studies regarding the reactivity of aromatic isocyanates with different substituents on the aromatic rings in the dimeric complex  $[\text{Ni}(\text{dippe})]_2(\mu-\text{H})_2$  [dippe = 1,2-bis(diisopropylphosphino)ethane], which is an excellent precursor of nickel(II), were started.

The asymmetric unit of the title compound (Fig. 1) consists of one  $[\text{Ni}(\text{oFPU})(\text{dippe})]$  molecule with oFPU = bis(2-fluorophenyl)urea. Both bidentate oFPU and dippe ligands

are coordinated to the Ni<sup>II</sup> ion, through the N and P atoms, respectively. The resulting coordination environment is distorted square-planar (Table 1), with the geometry index  $\tau_4 = 0.195$  ( $\tau_4 = 0$  for an ideal square-planar arrangement; Yang *et al.*, 2007). In the oFPU moiety, the fluorophenyl ring (F2, C22–C27) attached to N2 is disordered over two sets of sites. The aromatic rings are inclined to the NCON plane of urea by 62.90 (2) (C22–C27) and 70.58 (2) $^\circ$  (C15–C2); the angle between the two aromatic rings is 57.47 (2) $^\circ$ . Based on the relative orientation of the *ortho* substituents (considering only the major disorder component) with respect to the carbonyl group, the molecular conformation can be described as *anti-anti*, showing torsion angles (O)=C21–N1–C15–C16 and (O)=C21–N2–C22–C23 of 120.9 (6) and 117.0 (5) $^\circ$ , respectively. These values are consistent with those reported in the literature (Solomos *et al.*, 2017).

In the crystal packing (Fig. 2), there are intermolecular hydrogen-bonding interactions between the C donor atoms of dppe to O and F acceptor atoms oFPU (Table 2). The stron-

Computer programs: *CrysAlis PRO* (Agilent, 2013), *SHELXT2018* (Sheldrick, 2015a), *SHELXL2018* (Sheldrick, 2015b), *ORTEP-3* for Windows and *WinGX* (Farrugia, 2012) and *Mercury* (Macrae *et al.*, 2020).

gest interactions involving C1 $\cdots$ O1<sup>i</sup> [3.210 (6)  $\text{\AA}$ ] and C8 $\cdots$ F1<sup>i</sup> [3.398 (8)  $\text{\AA}$ ] lead to the formation of chains with an  $R_2^2(12)$  motif extending along [100].

**Figure 2**

Crystal packing of [Ni(oFPU)(dippe)], showing the strongest C—H $\cdots$ O and C—H $\cdots$ F contacts as dashed lines. For clarity, only the major component of the disordered fluorophenyl ring (F2/C22–C27) is shown.

## Synthesis and crystallization

A solution of 2-fluorophenylisocyanate (16 mg, 0.13 mmol) in THF (5 ml) was added dropwise to a stirring THF solution of  $[\text{Ni}(\text{dippe})(\mu\text{-H})_2]$  (35.9 mg, 0.058 mmol). A slight bubbling was observed, accompanied by colour changes from purple to green and then brown. The reaction mixture was subsequently heated at 353 K for 2 h. At the end of heating, the sample was placed in a vial, and left in an inert atmosphere for crystallization by evaporation of the solvent. After a few days, crystals formed, which were analyzed by single-crystal X-ray diffraction.

## Refinement

Crystal data, data collection and structure refinement details are summarized in Table 3. One of the fluorophenyl rings (F2/C22–C27) was found to be disordered over two sets of sites in a refined 0.832 (7):0.168 (7) ratio. Restraints on bond lengths, angles and displacement ellipsoids were used to model the disorder.

*Special details*

**Geometry.** All esds (except the esd in the dihedral angle between two l.s. planes) are estimated using the full covariance matrix. The cell esds are taken into account individually in the estimation of esds in distances, angles and torsion angles; correlations between esds in cell parameters are only used when they are defined by crystal symmetry. An approximate (isotropic) treatment of cell esds is used for estimating esds involving l.s. planes.

**Refinement.** F2 C22 C23 C24 C25 C26 C27 and F2P C22P C23P C24P C25P C26P C27P are disordered over two sites with occupancies 0.83:0.17.

The anisotropic ellipsoids of the atoms disordered were elongated, EADP constraint commands in the SHELXL2018 software were used.
