In the title triazole-based N-heterocyclic carbene rhodium(I) cationic complex with a tetrafluoridoborate counter-anion,  $[\text{Rh}(\text{C}_8\text{H}_{12})(\text{C}_8\text{H}_{15}\text{N}_3)(\text{C}_{18}\text{H}_{15}\text{P})]\text{BF}_4$ , which crystallizes with two cations and two anions in the asymmetric unit, the Rh center has a distorted square-planar coordination geometry with expected bond distances. Several nonclassical C—H···F hydrogen-bonding interactions help to consolidate the packing. Two of the F atoms of one of the anions are disordered over adjacent sites in a 0.814 (4):0.186 (4) ratio.

## Chemical scheme

## Structure description

N-Heterocyclic carbenes (NHCs) have become important alternatives to phosphines as ancillary ligands in transition-metal chemistry, synthesis, and in homogeneous catalysis (Cazin, 2013; de Frémont *et al.*, 2009; Díez-González *et al.*, 2009; Rovis & Nolan, 2013; Ruff *et al.*, 2016; Zuo *et al.*, 2014). Their catalytic activity in the transfer hydrogenation of ketones and imines has also been studied and reported (Albrecht *et al.*, 2002; Gnanamgari *et al.*, 2007). The use of N-heterocyclic carbenes as ligands and having different substituents on the N atoms, enables the variation of the steric and electronic properties of the metal center (Díez-González *et al.*, 2007; Gusev, 2009). Many imidazole- and triazole-based NHC rhodium and iridium complexes have been synthesized and structurally characterized (Herrmann *et al.*, 2006; Wang & Lin 1998; Chianese *et al.*, 2004). We continue to synthesize new imidazole- and triazole-based NHC complexes of rhodium and iridium to study the effect of different substituents on the NHC and the other ligands coordinated to the metal in transfer hydrogenation reactions (Nichol *et al.*, 2009, 2010, 2011, 2012; Idrees *et al.*, 2017*a,b*; Rood *et al.*, 2021; Rushlow *et al.*, 2021; Newman *et al.*, 2021; Castaldi *et al.*, 2021; Maynard *et al.*, 2023).

The molecular structure of the title complex,  $[\text{Rh}(\text{C}_8\text{H}_{12})(\text{C}_8\text{H}_{15}\text{N}_3)(\text{C}_{18}\text{H}_{15}\text{P})]\text{BF}_4$  (**4**), comprises an  $\text{Rh}^{\text{I}}$  cation complex and a tetrafluoridoborate counter-anion, illustrated in

**Table 1**  
Hydrogen-bond geometry ( $\text{\AA}$ ,  $^\circ$ ).

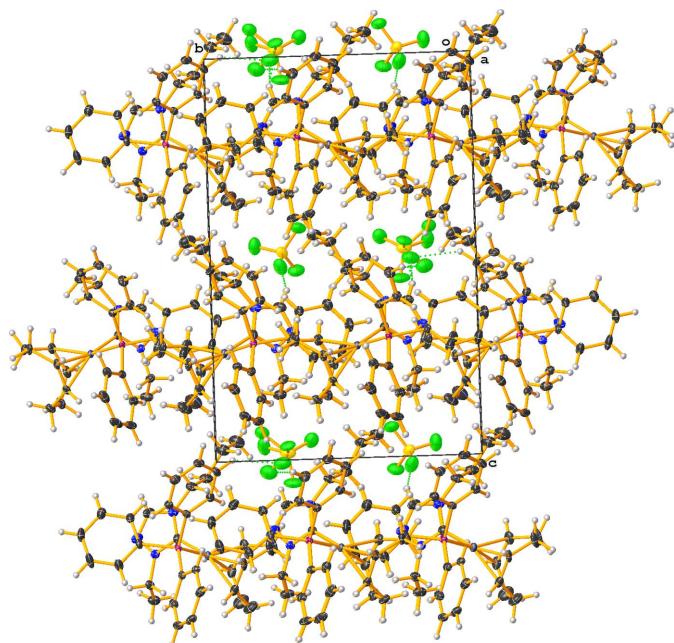

$D-\text{H}\cdots A$	$D-\text{H}$	$\text{H}\cdots A$	$D\cdots A$	$D-\text{H}\cdots A$
$\text{C}2-\text{H}2\cdots\text{F}3^{\text{i}}$	0.95	2.37	3.263 (5)	157
$\text{C}2-\text{H}2\cdots\text{F}1^{\text{n}i}$	0.95	1.81	2.722 (13)	160
$\text{C}17-\text{H}17\cdots\text{F}2^{\text{ii}}$	0.95	2.30	3.229 (17)	165
$\text{C}2'-\text{H}2'\cdots\text{F}3$	0.95	2.19	3.002 (5)	142
$\text{C}13'-\text{H}13'\cdots\text{F}1^{\text{n}iii}$	0.95	2.36	3.163 (17)	142

Symmetry codes: (i)  $x - 1, y, z - 1$ ; (ii)  $x, y, z - 1$ ; (iii)  $x, -y + 2, z - \frac{1}{2}$ .

Fig. 1. No solvent molecules were found in the structure. The compound crystallizes in the monoclinic space group  $Pc$  with two cations (A containing Rh1 and B containing Rh1') and two anions in the asymmetric unit. The coordination sphere around the  $\text{Rh}^{\text{I}}$  ion, formed by the bidentate (1,2,5,6- $\eta$ )-cycloocta-1,5-diene ligand ( $\text{C}_8\text{H}_{12}$ ; COD), the  $\text{C}_8\text{H}_{15}\text{N}_3$  NHC ligand and the triphenylphosphane ligand, results in a distorted  $\text{RhCP}(\eta^2\text{C}=\text{C})_2$  square-planar geometry. The carbene atom, C1/C1', deviates from the expected  $sp^2$  hybridization in that the  $\text{N}1-\text{C}1-\text{N}3$  (cation A) and  $\text{N}1'-\text{C}1'-\text{N}3'$  (cation B) bond angles are 103.3 (3) and 102.9 (3) $^\circ$ , respectively. Other selected bond lengths and angles in cations A and B are  $\text{Rh}-\text{C}_{\text{NHC}} = 2.034$  (4) and 2.038 (4)  $\text{\AA}$ ,  $\text{Rh}-\text{P} = 2.3162$  (9) and 2.3135 (9)  $\text{\AA}$ , and  $\text{C}_{\text{NHC}}-\text{Rh}-\text{P} = 91.84$  (10) and 90.63 (10) $^\circ$ , respectively. Fig. 2 shows the packing diagram of the title compound viewed along [100], with nonclassical  $\text{C}-\text{H}\cdots\text{F}$  hydrogen bonds shown as dotted green lines; the CH moieties for these interactions arise from both the N-heterocyclic carbene and phenyl moieties (Table 1). The extremely short  $\text{H}\cdots\text{F}$  contact distance of 1.81  $\text{\AA}$  for  $\text{C}2-\text{H}2\cdots\text{F}1$  is probably an artefact of disorder of the F atom.

### Synthesis and crystallization

1-Ethyl-1,2,4-triazole (**1**) was purchased from Matrix Scientific. All other compounds used in the syntheses were obtained from Sigma-Aldrich and Strem and used as received; all

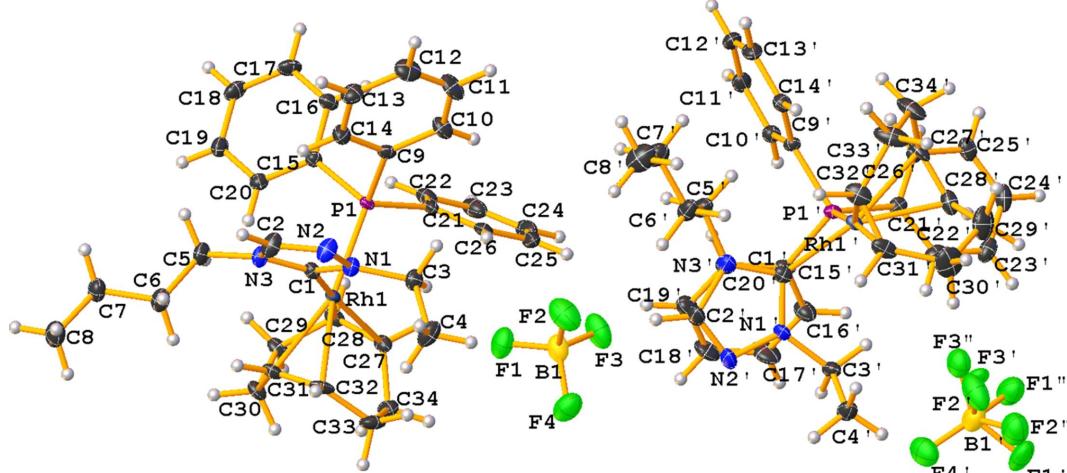

**Figure 2**

Crystal packing diagram of the title compound (**4**), viewed along the  $a$ -axis direction.  $\text{C}-\text{H}\cdots\text{F}$  hydrogen bonds are shown as dotted green lines.

syntheses were performed under a nitrogen atmosphere. The reaction scheme for the synthesis of the title compound is shown in Fig. 3. NMR spectra were recorded at room temperature in  $\text{CDCl}_3$  on a 400 MHz (operating at 100 MHz for  $^{13}\text{C}$  and 162 MHz for  $^{31}\text{P}$ ) Varian spectrometer and referenced to the residual solvent peak ( $\delta$  in ppm). The title compound (**4**) was crystallized by slow diffusion of pentane into a  $\text{CH}_2\text{Cl}_2$  solution.

**4-Butyl-1-ethyl-1,2,4-triazolium bromide (2):** 1-ethyl-1,2,4-triazole (**1**) (1.001 g, 10.30 mmol) and excess 1-bromobutane (5.113 g, 37.31 mmol) were added to toluene (15 ml), and the mixture was refluxed in the dark for 48 h. After the mixture was cooled, the white solid was filtered off, washed with ether,

## Refinement

All H atoms were placed geometrically and refined as riding atoms, with  $U_{\text{iso}}(\text{H}) = 1.2U_{\text{eq}}(\text{C})$  or  $1.5U_{\text{eq}}$ (methyl C). Two of the F atoms are disordered over adjacent sites in a 0.814 (4):0.186 (4) ratio. Refinement details are summarized in Table 2.

*Special details*

**Geometry.** All esds (except the esd in the dihedral angle between two l.s. planes) are estimated using the full covariance matrix. The cell esds are taken into account individually in the estimation of esds in distances, angles and torsion angles; correlations between esds in cell parameters are only used when they are defined by crystal symmetry. An approximate (isotropic) treatment of cell esds is used for estimating esds involving l.s. planes.
