The molecular structure of the solvated title salt, $(C_{21}H_{25}N_2)_2[Fe_2(C_{14}H_{10}S_2)_4] \cdot 2C_3H_7NO$ reveals that the anion is situated on a crystallographic inversion center in the triclinic space group $P\bar{1}$. The title compound crystallizes utilizing a network of weak π -stacking interactions of phenyl rings pertaining to the dithiolene unit. Moreover, the acidic imidazolium H atoms [N—C(H)—N] display non-classical hydrogen-bonding interactions of the C—H···O type to the oxygen atoms of the *N,N*-dimethyl formamide solvent, and hydrogen atoms on the backbone of imidazolium rings display weak C—H···S interactions with the dithiolene sulfur atoms.

Structure description

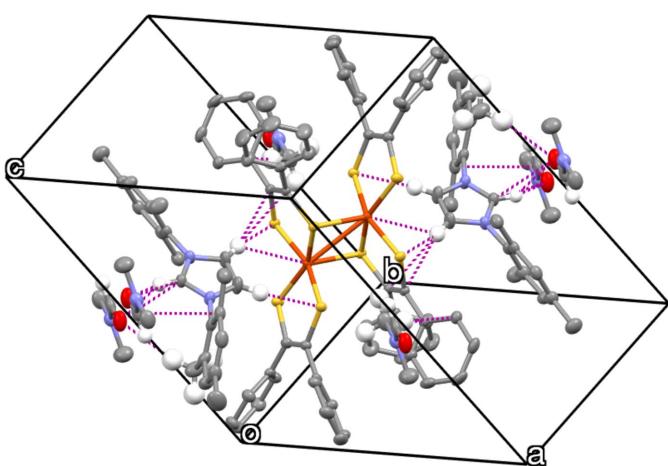

The iron bis(dithiolene) dimer, $[Fe(S_2C_2Ph_2)_2]$ (Schrauzer *et al.*, 1964), displays a rich electrochemistry and is generally characterized by two successive ligand-based reduction processes pertaining to the dithiolene units (Patra *et al.*, 2006; Ray *et al.*, 2005; Yu *et al.*, 2007). Despite their facile redox processes, the solid-state structure of the chemically reduced species $[Fe(S_2C_2Ph_2)_2]^{2-}$ have not yet been reported. Recently, we reported several five-coordinate iron bis(dithiolene) complexes with N-heterocyclic carbene ligands $[Fe(S_2C_2Ph_2)_2(NHC)]$ [NHC = 1,3-bis(2,4,6-trimethylphenyl)imidazol-2-ylidene; Selvakumar *et al.*, 2021]. Under electrochemical conditions, these complexes undergo two successive one-electron reductions, with the first reduction being reversible whereas the second reduction is irreversible. This irreversibility is attributed to the cleavage of the coordination of the N-heterocyclic carbene ligand to the respective iron atom (Selvakumar *et al.*, 2021). To isolate and study the solid-state structure of $[Fe(S_2C_2Ph_2)_2NHC]^-$, we reduced the neutral complex $[Fe(S_2C_2Ph_2)_2(NHC)]$ with a stoichiometric amount of

**Figure 1**

The molecular structure of the cations and the anion in the title compound, with displacement ellipsoids drawn at the 50% probability level. Hydrogen atoms are omitted for clarity. The solvent molecule was omitted for clarity. Only one cation was observed in the asymmetric unit and the other was generated by the inversion center at $(-x, -y, -z)$.

cobaltocene. The reduction process resulted in the decomplexation of NHC and the formation of $[\text{Fe}(\text{S}_2\text{C}_2\text{Ph}_2)_2]_2^{2-}$ with two $\text{NHC}[\text{H}]$ cations serving as counter-ions. Herein, we disclose the molecular structure and solid-state structural characteristics of $[\text{Fe}(\text{S}_2\text{C}_2\text{Ph}_2)_2][\text{NHC}[\text{H}]]_2$ (Fig. 1).

Since the reductions of the substrate complex are predominantly ligand-based (Patra *et al.*, 2006), the bis(dithiolene) unit of $[(\text{Fe}(\text{S}_2\text{C}_2\text{Ph}_2)_2)(\text{NHC})]$ undergoes a conversion from thienyl radical monoanions ($\text{S}-\text{C}\equiv\text{C}-\text{S}^-$) to fully reduced 1,2-ene-dithiolate ($\text{S}-\text{C}\equiv\text{C}-\text{S}^-$). The C–S bond lengths in the title compound [$\text{C}1-\text{S}1 = 1.762(2)$ Å, $\text{C}2-\text{S}2 = 1.770(3)$ Å, $\text{C}3-\text{S}3 = 1.764(2)$ Å, $\text{C}4-\text{S}4 = 1.757(2)$ Å] are in agreement with pure C–S single-bond lengths. The $\text{C}1-\text{C}2$ [1.353(3) Å] and $\text{C}3-\text{C}4$ [1.352(3) Å] bond lengths are consistent with a double-bond character. Hence, the interpretation of the ligands as 1,2-ene-dithiolates is confirmed.

**Figure 2**

Intermolecular $\text{C}-\text{H}\cdots\text{O}$ and $\text{C}-\text{H}\cdots\text{S}$ interactions (dotted lines) in the title compound.

Table 1
Hydrogen-bond geometry (Å, °).

$D-\text{H}\cdots A$	$D-\text{H}$	$\text{H}\cdots A$	$D\cdots A$	$D-\text{H}\cdots A$
$\text{C}29-\text{H}29\cdots\text{O}1$	0.93 (1)	2.22 (1)	3.038 (3)	147 (1)
$\text{C}30-\text{H}30\cdots\text{O}1$	0.93 (1)	2.77 (1)	3.593 (3)	148 (1)
$\text{C}31-\text{H}31\cdots\text{S}1$	0.93 (1)	2.87 (1)	3.763 (3)	162 (1)
$\text{C}49-\text{H}49\cdots\text{O}1$	0.96 (1)	2.59 (1)	3.529 (4)	167 (1)

Analysis of the molecular structure revealed no classical hydrogen bonds. However, the presence of non-classical hydrogen-bonding interactions involving $\text{C}-\text{H}\cdots\text{O}$ and $\text{C}-\text{H}\cdots\text{S}$ interactions (Fig. 2) is observed. The $\text{C}-\text{H}\cdots\text{O}$ and $\text{C}-\text{H}\cdots\text{S}$ interactions are detailed in Table 1. Moreover, the molecules are also interconnected by intermolecular $\text{C}\cdots\text{C}$ interactions of the phenyl rings pertaining to the dithiolene units (Fig. 3). All these interactions combine to yield a tri-periodic molecular structure.

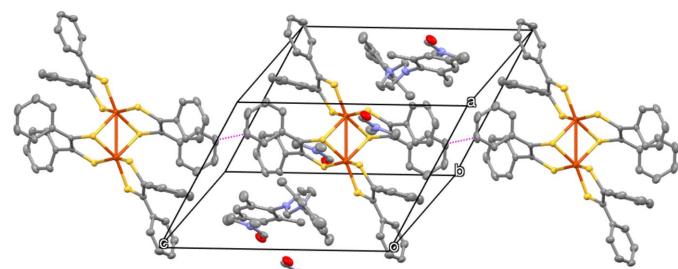

A CSD structure search for the core $[\text{Fe}(\text{S}_2\text{C}_2\text{Ph}_2)_2]_2^{2-}$ revealed no hits. However, structurally similar compounds have been reported in the literature, *viz.* $[\text{Fe}(\text{S}_2\text{C}_2(\text{C}_6\text{H}_4-p\text{-OCH}_3)_2)_2]_2^{2-}$ (Yu *et al.*, 2007), $[\text{Fe}(\text{S}_2\text{C}_6\text{H}_4)_2]_2^{2-}$ (Ray *et al.*, 2005), and $[\text{Fe}(\text{S}_2\text{C}_6\text{H}_3(\text{o-CH}_2\text{CH}_3))_2]_2^{2-}$ (Ray *et al.*, 2005). The Fe–S, C–S, and C–C bond lengths for $[\text{Fe}(\text{S}_2\text{C}_2\text{Ph}_2)_2]_2^{2-}$ are in agreement with those in the reported compounds.

Synthesis and crystallization

Cobaltocene (Cp_2Co) (3.8 mg, 0.02 mmol) in 1 ml of *N,N*-dimethyl formamide (DMF) was added dropwise to a stirred solution of $[(\text{Fe}(\text{S}_2\text{C}_2\text{Ph}_2)_2)(\text{NHC})]$ (17 mg, 0.02 mmol; NHC = 1,3-dimesitylimidazol-2-ylidene) in 2 ml of DMF. This addition induced a colour change of the solution from dark green to brown. After stirring 30 min at 25°C, the reaction mixture was filtered through a celite plug. The filtrate was subjected to vial in a vial for crystallization according to the vapour diffusion method. Brown plate-like shaped crystals of the title compound $[(\text{Fe}(\text{S}_2\text{C}_2\text{Ph}_2)_2)][\text{NHC}(\text{H})]_2$ were obtained by diffusion of toluene into the brown reaction mixture containing DMF as the solvent (yield: 11 mg, 60%).

Refinement

Crystal data, data collection and structure refinement details are summarized in Table 2.

**Figure 3**

Intermolecular $\text{C}\cdots\text{C}$ interactions of the phenyl rings (dotted lines) in the title compound.

Special details

Refinement. Aromatic C–H H atoms were added using the riding-model approximation with C–H bond lengths of 0.95 Å with $U_{\text{iso}}(\text{H}) = 1.2 U_{\text{eq}}(\text{C}_{\text{ar}}\text{H})$. Methyl (CH_3) H atoms were treated as a rotating group and added using the riding-model approximation to the carbon atom to which they are attached. Methyl H atoms were fixed at a distance of 0.98 Å with $U_{\text{iso}}(\text{H}) = 1.5 U_{\text{eq}}(\text{CH}_3)$. The title compound co-crystallized with one solvent molecule (*N,N*-dimethyl formamide) per asymmetric unit of the unit cell.
