**Keywords:** crystal structure; oxidotungstate(VI); neodymium; scheelite.**CCDC reference:** 2312842**Structural data:** full structural data are available from [iucrdata.iucr.org](http://iucrdata.iucr.org)

Neodymium(III) *ortho*-oxidotungstate(VI) was synthesized as a side-product in an unsuccessful synthesis attempt at fluoride derivatives of neodymium tungstate in fused silica ampoules, using neodymium(III) oxide, neodymium(III) fluoride and tungsten trioxide. Violet, platelet-shaped single crystals of the title compound emerged of the bulk, which crystallize in the defect scheelite type with a trigonal dodecahedral coordination of oxide anions around the  $\text{Nd}^{3+}$  cations and the hexavalent tungsten cations situated in the centers of oxide tetrahedra.

## Structure description

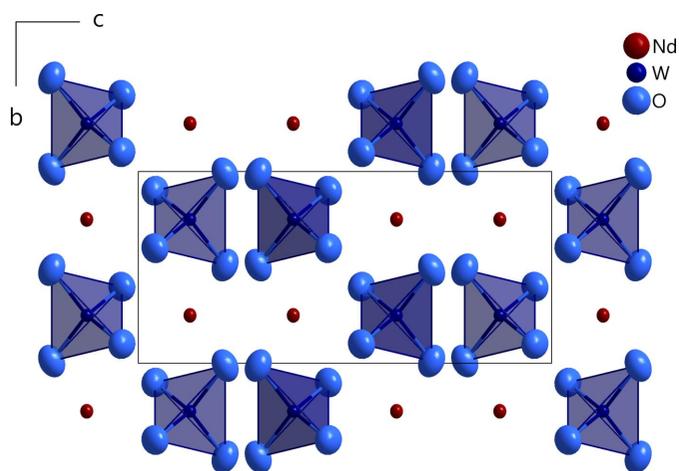

$\text{Nd}_{2/3}[\text{WO}_4]$  crystallizes in the defect scheelite structure type (space group  $I4_1/a$ , Dickinson, 1920; see Fig. 1). The tungsten cations (Wyckoff position  $4a$ , site symmetry  $\bar{4}$ ) form regular tetrahedra  $[\text{WO}_4]^{2-}$  together with four oxide anions, exhibiting a bond length of 1.783 (4) Å. The neodymium cations (Wyckoff position  $4b$ , site symmetry  $\bar{4}$ ) are coordinated by eight oxide anions, forming a slightly distorted trigonal dodecahedron, in which two different bond lengths, 2.483 (4) Å and 2.516 (4) Å, each one appearing four times, are found (Fig. 2). The distance between two neodymium cations is 3.9116 (2) Å. The corresponding oxidomolybdate(IV),  $\text{Nd}_{2/3}[\text{MoO}_4]$ , crystallizes in the same structure type (Schustereit *et al.*, 2011).

Another, formula-analogous polymorph of neodymium(III) *ortho*-oxidotungstate(VI) with the composition  $\text{Nd}_2[\text{WO}_4]_3$  is already known in literature (Weil *et al.*, 2009), with this compound crystallizing in the *scheelite*-derived  $\text{Eu}_2[\text{WO}_4]_3$  structure type (space group  $C2/c$ ; Templeton & Zalkin, 1963). The main difference between these polymorphs is the emergence of a fifth, slightly longer distance from  $\text{W}^{6+}$  to  $\text{O}^{2-}$  in  $\text{Nd}_2[\text{WO}_4]_3$ , resulting in  $[\text{W}_2\text{O}_8]^{4-}$  entities, built of two edge-sharing rectangular pyramids being present in its crystal structure, while in the title compound  $\text{Nd}_{2/3}[\text{WO}_4]$  the  $[\text{WO}_4]^{2-}$  tetrahedra remain isolated from each other. A rare-earth metal oxidotungstate(VI),

crystallizing in the scheelite-type with a fully occupied cationic position is known with  $\text{Eu}^{2+}$  cations, namely  $\text{Eu}[\text{WO}_4]$  (López-Moreno *et al.*, 2011).

### Synthesis and crystallization

Single-crystals of  $\text{Nd}_{2/3}[\text{WO}_4]$  formed in an unsuccessful synthesis attempt to achieve fluoride derivatives of neodymium tungstate, which was performed in fused silica ampoules, utilizing neodymium trifluoride, neodymium(III) oxide and tungsten trioxide as starting materials at approximately 1123 K. The crystals emerged as violet platelets and remained stable under atmospheric conditions.

### Refinement

Crystal data, data collection and structure refinement details are summarized in Table 1. The site occupancy of the neodymium cations was fixed at 2/3 to maintain electroneutrality.

### Funding information

*Special details*

**Geometry.** All esds (except the esd in the dihedral angle between two l.s. planes) are estimated using the full covariance matrix. The cell esds are taken into account individually in the estimation of esds in distances, angles and torsion angles; correlations between esds in cell parameters are only used when they are defined by crystal symmetry. An approximate (isotropic) treatment of cell esds is used for estimating esds involving l.s. planes.
