The structure of the title compound, $\mathrm{C}_{8} \mathrm{H}_{7} \mathrm{IO}_{3}$, at 90 K has monoclinic $\left(P 2_{1} / c\right)$ symmetry. The extended structure is layered and displays intermolecular and intramolecular hydrogen bonding arising from the same OH group.

## 3D view

## Chemical scheme

## Structure description

2-Hydroxybenzoic acid methyl ester $\left(\mathrm{C}_{8} \mathrm{H}_{8} \mathrm{O}_{3}\right)$, commonly known as methyl salicylate, and its derivatives have been shown to display biological effects such as anti-inflammatory, anti-fungal, and process signaling (Yoon et al., 2019; Li et al., 2016; Park et al., 2007). It can also be found in various foods (Duthie \& Wood, 2011). The title compound, 2-hydroxy-4-iodobenzoic acid methyl ester (methyl 4-iodosalicylate, $\mathrm{C}_{8} \mathrm{H}_{7} \mathrm{IO}_{3}$ ) allows for an effective way of incorporating the said methyl salicylates within larger organic molecules, using such methodologies as McClure protocols (Franchi et al., 2010; McClure et al., 2001), Stille (Yoon et al., 2019; Stille, 1986) and Suzuki-Miyaura reactions (Fracaroli et al., 2014; Miyaura et al., 1979), which take advantage of the iodine atom at the 4 -position of the aromatic ring for the formation of carbon-carbon bonds. The iodine atom is also capable of forming supramolecular synthons, which may be useful for crystal engineering (Desiraju, 1995; Cherukuvada et al., 2016; Mitchell et al., 2023).

At 90 K the title compound displays monoclinic $\left(P 2_{1} / c\right)$ symmetry with one molecule in the asymmetric unit (Fig. 1). Intermolecular hydrogen bonding interactions occur between the hydroxy groups of one molecule and the carbonyl oxygen atom of the methyl ester of an adjacent molecule to form a centrosymmetric dimeric pair (Table 1, Fig. 2) with $\mathrm{H} \cdots \mathrm{O}=2.53(4) \AA$. An $\mathrm{O} 3-\mathrm{H} 3 \cdots \mathrm{O} 2$ intramolecular hydrogen bond also exists with an $\mathrm{H} \cdots \mathrm{O}$ distance of 2.05 (4) $\AA$. The $\mathrm{C} 5 \cdots \mathrm{C} 8[3.326$ (3) $\AA$ A and O3 $\cdots \mathrm{H} 1 C(2.51 \AA)$ interactions provide the only short contacts between the stacks of offset ( $\overline{1} 02$ ) parallel sheets, which make up the crystal (Fig. 3). These sheets, in turn, contain the inversiongenerated hydrogen-bonded dimers (Fig. 2). The non-hydrogen atoms of the molecule are essentially coplanar with no displacement from the mean molecular plane greater than $0.132 \AA$ (Fig. 4).

Figure 1
The molecular structure of the title compound showing $50 \%$ displacement ellipsoids. The intramolecular hydrogen bond is indicated by a red dashed line.

## Crystallization

Methyl 4-iodosalicylate ( $32.8 \mathrm{mg}, 0.118 \mathrm{mmol}$ ) was added to a 20 ml scintillation vial to which benzene $(\sim 2 \mathrm{ml})$ was added, and the vial shaken until the compound dissolved. The

## Special details

Geometry. All esds (except the esd in the dihedral angle between two 1.s. planes) are estimated using the full covariance matrix. The cell esds are taken into account individually in the estimation of esds in distances, angles and torsion angles; correlations between esds in cell parameters are only used when they are defined by crystal symmetry. An approximate (isotropic) treatment of cell esds is used for estimating esds involving l.s. planes.
Refinement. The O-bound H atom was located in a difference map and its position was freely refined. The C-bound H atoms were geometrically placed $(\mathrm{C}-\mathrm{H}=0.95-0.98 \AA)$ and refined as riding atoms.
