Keywords: crystal structure; iron; porphyrin derivative; hydrogen bonds.**CCDC reference:** 2358334**Structural data:** full structural data are available from iucrdata.iucr.org

The title compound, $[\text{Fe}(\text{C}_{84}\text{H}_{52}\text{N}_{12}\text{O}_4)\text{Cl}]$, crystallizes in space group $C2/c$. The central Fe^{III} cation (site symmetry 2) is coordinated in a fivefold manner, with four pyrrole N atoms of the porphyrin core in the basal sites and one Cl atom (site symmetry 2) in the apical position, which completes a slightly distorted square-pyramidal environment. The porphyrin macrocycle shows a characteristic ruffled-shape distortion and the iron atom is displaced out of the porphyrin plane by 0.42 Å with the average Fe–N distance being 2.054 (4) Å; the Fe–Cl bond length is 2.2042 (7) Å. Intermolecular C–H...N and C–H...O hydrogen bonds occur in the crystal structure.

Structure description

The relationship between the structural variations of iron porphyrins and the functional diversity of hemoproteins has been investigated extensively in the literature (Adam *et al.*, 2018). As an exemplar porphyrin model, the molecular structure of the 'picket-fence' porphyrin, 5,10,15,20-tetrakis(*o*-pivalamidophenyl)porphyrin (referred to as TpivPP) has been thoroughly investigated. The Collman group first reported the crystal structure of a picket-fence metalloporphyrin, $[\text{Fe}(\text{TpivPP})(1\text{-MeIm})(\text{O}_2)]$ (1-MeIm = 1-methylimidazole; Collman *et al.*, 1975). Subsequently, several analogues of picket-fence compounds have been synthesized. The Gunter group devised a model compound, 5,10,15,20-tetrakis(*o*-nicotinamidophenyl)porphyrin, modeled after the classical picket-fence porphyrin, with the substitution of the *tert*-butyl group at the terminus by a pyridine group (Gunter *et al.*, 1980). Similarly, Yao and co-workers developed 5,10,15,20-tetrakis(5-imidazole-carboxylaminophenyl)porphyrin by substituting the *tert*-butyl group at the terminus with an imidazole group (Yao *et al.*, 2020). In this study, we replaced the terminal *tert*-butyl group with a 7-quinoline group, and determined the crystal structure of the title compound $[\text{Fe}(\text{C}_{84}\text{H}_{52}\text{N}_{12}\text{O}_4)\text{Cl}]$.

Figure 1
The molecular structure of the title compound with displacement ellipsoids drawn at the 50% probability level. Hydrogen atoms have been omitted for clarity.

The asymmetric unit contains one Fe atom and one Cl atom (both site symmetry 2) and half of the porphyrin ligand, which is completed by crystallographic twofold symmetry. There are no solvent molecules present in the crystal. As depicted in Fig. 1, the new crystal demonstrates a five-coordinate structure of the metal atom with a significant out-of-plane displacement. The axial chloride ligand is positioned within the molecular cavity on the hindered porphyrin side. Further structural details are presented in supplementary Fig. 1, including the specific displacements of each porphyrin core atom from the 24-atom mean plane. Additionally, averaged values of the chemically unique bond lengths (Å) and angles (°) are provided. Notably, the porphyrin macrocycle exhibits a characteristic ruffled-shaped distortion, with the Fe^{III} atom displaced out of the porphyrin plane by 0.42 Å, and an average Fe–N_p distance of 2.054 (4) Å (N_p represents a porphyrin N atom). The Fe–Cl bond length is 2.2042 (7) Å (Table 1).

Several intra- and inter-molecular interactions are identified in the title compound, as presented in Table 2 and Fig. 2.

Figure 2
Intra- and inter-molecular interactions in the crystal structure of the title compound.

Table 1
Selected geometric parameters (Å, °).

Fe1–Cl1	2.2042 (7)	Fe1–N2	2.0581 (13)
Fe1–N1	2.0508 (13)		
N1–Fe1–Cl1	102.93 (4)	N2–Fe1–Cl1	101.67 (4)
N1 ⁱ –Fe1–N1	154.14 (8)	N2 ⁱ –Fe1–N2	156.66 (7)
N1–Fe1–N2 ⁱ	87.60 (5)		

Symmetry code: (i) $-x + 1, y, -z + \frac{1}{2}$.

Table 2
Hydrogen-bond geometry (Å, °).

D–H...A	D–H	H...A	D...A	D–H...A
C15–H15...O2	0.95	2.25	2.871 (3)	122
C31–H31...O1	0.95	2.25	2.867 (2)	122
C42–H42...Cl1	0.95	2.77	3.3596 (18)	121
C3–H3A...N5 ⁱⁱ	0.95	2.48	3.411 (2)	166
C14–H14...O1 ⁱⁱⁱ	0.95	2.45	3.165 (2)	132

Symmetry codes: (ii) $-x + 1, -y + 1, -z + 1$; (iii) $-x + \frac{1}{2}, y - \frac{1}{2}, -z + \frac{1}{2}$.

The distance between C3 and N5 and the C3–H3A...N5 angle are 3.411 (2) Å and 166°, respectively. These values are consistent with literature data where the C...N separation of C–H...N hydrogen bonds ranges from 2.4–3.9 Å (Rabaça *et al.*, 2022) with angles of 100–171° (Shivakumar *et al.*, 2012). Furthermore, the distances between C15 and O2, and C31 and O1 are 2.871 (3) Å and 2.867 (2) Å, respectively, which align with literature data where the C...O separation of C–H...O bonds ranges from 3.00–4.00 Å (Desiraju, 1996) with angles of 120–180° (Thakur *et al.*, 2015). The molecular packing arrangement is illustrated in Fig. 3.

Figure 3
A view of the packing of the title compound. H atoms have been omitted for clarity.

Synthesis and crystallization

All experimental procedures were carried out under an argon atmosphere using a double-manifold vacuum line, Schlenkware, and cannula techniques. Except for the solvent employed in column chromatography, all solvents used in the experimental protocols underwent thorough drying and purging under anhydrous and anaerobic conditions. Solvents utilized within the anhydrous and anaerobic operations (Schlenk system) underwent the freeze–pump–thaw method three times prior to utilization.

The synthesis of the precursor 5,10,15,20-tetrakis-(quinoline-7-carboxamide)porphyrin followed the procedures outlined in a previous publication (Yao *et al.*, 2020). Initially, oxalyl chloride (2.2 mmol) was added to a suspension of 7-quinolinecarboxylic acid (1 mmol) in a solvent mixture of 15 ml dichloromethane (DCM) and 10 μ l *N,N*-dimethylformamide in a nitrogen-protected atmosphere. The reaction mixture was stirred at room temperature for 1 h and concentrated *in vacuo*. The resulting solid was used in the subsequent step without further purification. Dry DCM (25 ml) containing 7-quinolinecarboxylic acid chloride was mixed with

$\alpha\alpha\alpha$ -H₂TamPP (0.2 mmol) and 2,6-lutidine (270 μ mol). The resulting solution was refluxed for 90 minutes and concentrated to dryness. The obtained product was purified through chromatography on a silica gel column using an elution solvent mixture of CHCl₃:CH₃OH in a ratio of 12:1, resulting in a yield of 70%. Subsequently, the chloro-iron porphyrin compound was prepared. To a solution of the free base porphyrin (*ca.* 100 μ mol) in tetrahydrofuran (30 ml), FeCl₂ (20 equiv) and 2,6-lutidine (50 μ l) were added. The mixture was refluxed overnight and concentrated to dryness. The resulting product was purified through chromatography on a silica gel column using an elution solvent composed of CHCl₃:CH₃OH in a ratio of 9:1, resulting in a yield of 70%. To produce X-ray-quality crystals, we utilized a vapor diffusion technique, wherein *n*-hexane was introduced into a 3 mM dichloromethane (CH₂Cl₂) solution to initiate crystallization.

Refinement

Crystal data, data collection and structure refinement details are summarized in Table 3.

Special details

Geometry. All esds (except the esd in the dihedral angle between two l.s. planes) are estimated using the full covariance matrix. The cell esds are taken into account individually in the estimation of esds in distances, angles and torsion angles; correlations between esds in cell parameters are only used when they are defined by crystal symmetry. An approximate (isotropic) treatment of cell esds is used for estimating esds involving l.s. planes.
