Pinaverium bromide

Yoann Rousselin^{a*} and Alexandre Clavel^b

^aUniversité de Bourgogne, ICMUB-UMR 6302, 9 avenue Alain Savary, 21000 Dijon, France, and ^bM2I Salin, Route d'Arles, 13129 Salin-de-Giraud, France. *Correspondence e-mail: Yoann.Rousselin@u-bourgogne.fr

The structure of pinaverium bromide (systematic name: 4-[(2-bromo-4,5-dimethoxyphenyl)methyl]-4-{2-[2-(6,6-dimethyl-2-bicyclo[3.1.1]heptanyl)ethoxy]ethyl}morpholin-4-ium bromide; $C_{26}H_{41}Br_2NO_4$), was determined at 110 K. It has monoclinic ($P2_1$) symmetry. It is of interest with respect to its anti-inflammatory properties. The asymmetric unit contains two independent molecules, one of which exhibits disorder of the bicyclo terminal group (occupancy factors: 0.78 and 0.22).

Structure description

Pinaverium bromide is a medication used for functional gastrointestinal disorders. It belongs to a group of drugs called antispasmodics and acts as a calcium channel blocker, helping to restore the normal contraction process of the bowel (Zheng *et al.*, 2015). It is most effective when taken for a full course of treatment and is not designed for immediate symptom relief or sporadic, intermittent use (Wikipedia, 2023).

The compound crystallizes with two molecules per asymmetric unit (Fig. 1), one of which exhibits disorder of the dimethylbicycloheptane unit (fixed site occupancies: 0.78 and 0.22). The molecule consists of a dimethylbicycloheptane linked by an ethoxyethyl chain to a morpholinium group, which is itself linked to a bromodimethoxyphenylmethyl group. The species is present in the form of a cation, and the bromide counter-ion ensures neutrality. The charge is carried by nitrogen, as indicated by the average C–N bond lengths of 1.528 (17) Å and the N–C–N angles of 109 (2)°. The ring puckering analysis (Cremer & Pople, 1975; Table 1) confirms the chair conformation of the morpholinium group and the half-boat conformation of the six-membered rings of the dimethylbicycloheptane groups in both molecules. All dimethylbicycloheptanes have the same absolute configuration: *S*-C18, *S*-C21 and *S*-C23, as depicted in Fig. 2 for the non-disordered molecule.

If we define three planes $P1$, $P2$, and $P3$ (Fig. 3) corresponding respectively to the five atoms of the dimethylbicycloheptane (C18–C23), the plane formed by the six atoms of the morpholinium group (N1/O3/C10–C13), and the plane formed by the benzene ring of

Table 1
Cremer & Pople analysis (\AA , $^\circ$).

the bromodimethoxyphenylmethyl group (C3–C8), the angles between $P1$ and $P2$ vary in the two independent molecules [15.23 (17), 88.1 (7) and 111.4 (3) $^\circ$], whereas the angles between $P2$ and $P3$ remain close to a right angle [97.52 (13) and 90.84 (13) $^\circ$]. The superposition of the molecules, with the Automatic Molecule Overlay feature of *Mercury* (Macrae *et al.*, 2020), results in an r.m.s. deviation of 1.332 \AA and a maximum deviation of 3.743 \AA . Overlaying the two molecules shows that only the dimethylbicycloheptane part differs. In terms of the crystal packing, no specific interactions were

found; the two molecules are arranged head-to-tail in the unit cell (Fig. 4).

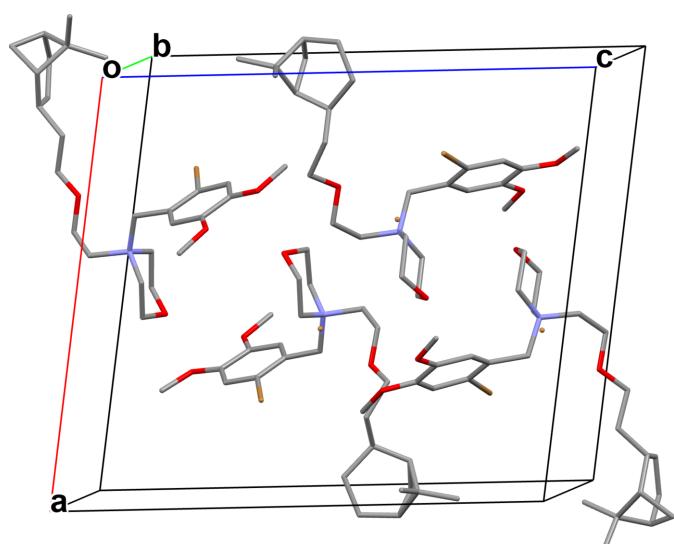

Figure 4

Crystal packing of the title compound, as viewed down the b axis. Disordered parts and H atoms are omitted for clarity.

Synthesis and crystallization

Pinaverium bromide was obtained by a two-step synthesis. A mixture of dihydronopol, morpholinochloroethane hydrochloride and aqueous sodium hydroxide was stirred until completion of the reaction. The product was washed with water until the pH was 5–6, and the reaction mixture was then concentrated under reduced pressure. An equimolar amount of the isolated intermediate was then mixed with 1-bromo-2-bromomethyl-4,5-dimethoxybenzene in methyl ethyl ketone, and stirred at 333 K until completion of the reaction. The resulting solid precipitate was then washed several times with methyl ethyl ketone, giving pinaverium bromide as a white powder with an overall yield of 60%. Some colourless crystals were obtained by slow evaporation of a trifluorotoluene solution.

Refinement

Crystal data, data collection and structure refinement details are summarized in Table 2. One dimethylbicycloheptane group is disordered over two sites (parts *A* and *B* in Fig. 1), and their occupancies were fixed to 0.78 and 0.22. The minor part of the disorder (part *B*) was refined with isotropic C atoms. Moreover, displacement parameters in the disordered parts were restrained: in each part, C atoms were restrained to have the same displacement parameters, with standard deviation of 0.02 Å², and rigid-bond hard restraints were applied, with standard deviations of 0.0001 Å² for the 1,2 and 1,3 distances (*SIMU* and *RIGU* commands, respectively; Sheldrick, 2015b). The absolute configuration was established by anomalous dispersion effects of Br sites.

Acknowledgements

The Ministère de l'Enseignement Supérieur et de la Recherche, the Centre National de la Recherche Scientifique (CNRS) and the Conseil Régional de Bourgogne Franche-Comté are gratefully acknowledged. This work is supported by the Université de Bourgogne and the Conseil Régional de Bourgogne Franche-Comté through the Plan d'Actions Régional pour l'Innovation (PARI) and the European Union through the PO FEDER-FSE Bourgogne 2014/2020 programs. The X-ray analyses were recorded in the Pôle Chimie Moléculaire, the technological platform for chemical analysis and molecular synthesis (<http://www.wpcm.fr>), which relies on the Institute of the Molecular Chemistry of the University of Burgundy (ICMUB) and SATT Sayens, a Burgundy University private subsidiary.
