The title structure, $[(\text{Cu}(\text{C}_4\text{H}_{11}\text{NO})_3)[\text{Cu}_4(\text{CN})_6]\cdot[\text{Cu}(\text{C}_4\text{H}_{10}\text{NO})_2(\text{H}_2\text{O})]\cdot\text{H}_2\text{O}]_n$, is made up of diperiodic honeycomb $\text{Cu}^{\text{I}}\text{CN}$ networks built from $[\text{Cu}_4(\text{CN})_6]^{2-}$ units, together with two independent Cu^{II} complexes: six-coordinate $[\text{Cu}(\text{CH}_3\text{CH}_2\text{CH}(\text{NH}_2)\text{CH}_2\text{OH})_3]^{2+}$ cations, and five-coordinate $[\text{Cu}(\text{CH}_3\text{CH}_2\text{CH}(\text{NH}_2)\text{CH}_2\text{O})_2\text{H}_2\text{O}]$ neutral species. The two Cu^{II} complexes are not covalently bonded to the $\text{Cu}^{\text{I}}\text{CN}$ networks. Strong O—H···O hydrogen bonds link the Cu^{II} complexes into pairs and the pairs are hydrogen bonded into chains along the crystallographic *b* axis *via* the hydrate water molecule. In addition, O—H···(CN) and N—H···(CN) hydrogen bonds link the cations to the CuCN network. In the honeycomb polymeric moiety, all bridging cyanido ligands are disordered over two orientations, head-to-tail and tail-to-head, with occupancies for C and N atoms varying for each CN group.

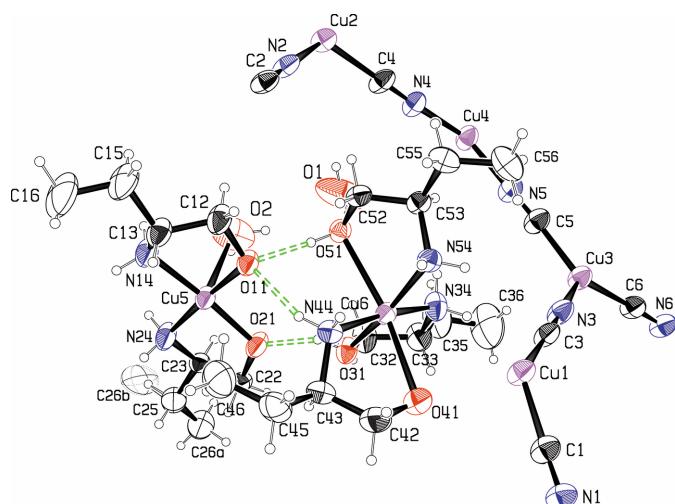

Structure description

Copper cyanide networks are of continuing interest because of the wide variety of different networks found (Pike, 2012; Iwai *et al.*, 2023) and the interesting and potentially useful magnetic or photoluminescent properties shown by some of them (*e.g.* Lim *et al.*, 2008). Anionic $\text{Cu}^{\text{I}}\text{CN}$ networks, which are hosts to cationic conjugate acids of various amine bases, have been studied in order to understand how the various network structures relate to the nature of the hosted cations – the so-called template effect – and to investigate certain physical properties of the network structures (*e.g.* Pretsch & Hartl, 2004; Corfield *et al.*, 2022). There are fewer structurally characterized mixed-valence organic CuCN networks in the literature. Our previous work in this area has involved attempts to synthesize neutral CuCN networks that fully incorporate both Cu^{I} and Cu^{II} atoms (Corfield *et al.*, 2024; Corfield & Sabatino, 2017).

**Figure 1**

The asymmetric unit of the title compound, with 30% displacement ellipsoids. Colours are: C, H black; O red; N blue; Cu magenta. H atoms associated with the disordered methyl group C26b are omitted for clarity. Hydrogen bonds linking the Cu^{II} complexes together are shown as green dashed lines. H41 is not visible, as it is located behind O41 in this figure.

The title compound was obtained serendipitously during attempts to continue syntheses of these mixed-valence CuCN networks with the use of the base 2-amino-1-butanol. Instead of the expected structure type, with CN bridging Cu^I and Cu^{II} atoms, we obtained the title compound, where a Cu^ICN network is host to guest Cu^{II} complexes. The asymmetric unit shown in Fig. 1 is comprised of Cu^I atoms (Cu1 to Cu4), Cu^{II} atoms (Cu5 and Cu6), six bridging cyanido ligands, five 2-amino-1-butanol bases, and two water molecules, O2 coordinated to Cu5 and O1 situated separately.

Of the two Cu^{II} atoms, Cu5 is coordinated by the two bases O11···C16 and O21···C26, as well as by a water molecule, in a square-pyramidal arrangement with the H₂O in the apical position, at a distance of 2.582 (12) Å. The bases have both lost their hydroxy protons, making this complex neutral in charge. The bases are in the *cis* position relative to each other, and the chelated conformations are both λ . Atom Cu6 is coordinated by three chelating bases that have all kept their OH protons, so that this complex has a +2 charge. The chelates are all in the λ conformation. The coordination around Cu6 is elongated octahedral. Base O31···C36 coordinates in the equatorial plane, while bases O41···C46 and O51···C56 have their NH₂ groups in the equatorial plane, and their OH groups in the axial positions, with long Cu—O axial bonds, at 2.508 (6) and 2.453 (5) Å. Bond Cu—O31 in the equatorial plane is much shorter at 1.956 (4) Å, although this distance is longer than the Cu—O distances of 1.901 (4) and 1.904 (4) Å in the Cu5 complex, where the H atoms have been lost. The equatorial Cu—N bond lengths in the octahedral complex of Cu6 average 2.022 (4) Å, slightly longer than those in the square-pyramidal Cu5 complex, which average 1.989 (5) Å.

Hydrogen bonds are listed in Table 1. The two Cu^{II} complexes are linked together by the short hydrogen bonds O31—H31···O21 and O51—H51···O11, as shown in Fig. 1. A

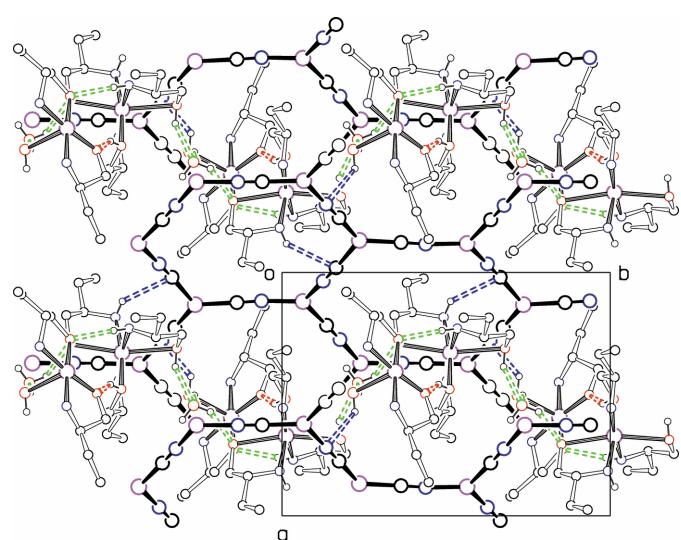

Table 1
Hydrogen-bond geometry (Å, °).

D—H···A	D—H	H···A	D···A	D—H···A
O31—H31···O21	0.80 (3)	1.66 (2)	2.393 (6)	152 (4)
O51—H51···O11	0.83 (2)	1.74 (3)	2.562 (6)	174 (5)
N44—H44B···O11	0.89	2.10	2.950 (7)	159
O41—H41···O1 ⁱ	0.86 (3)	1.93 (5)	2.726 (10)	154 (9)
N54—H54A···C2 ⁱⁱ	0.89	2.51	3.180 (7)	133
O1—H1A···O51	0.84 (3)	1.93 (10)	2.669 (9)	146 (16)
O2—H2B···N3 ⁱⁱⁱ	0.89 (3)	2.47 (12)	3.125 (13)	130 (13)

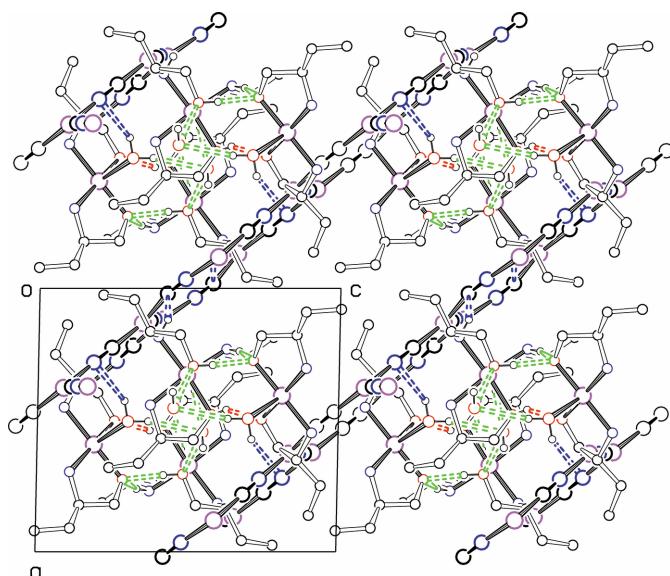

Symmetry codes: (i) $-x+1, y+\frac{1}{2}, -z+1$; (ii) $-x, y+\frac{1}{2}, -z+1$; (iii) $-x+1, y-\frac{1}{2}, -z+1$.

somewhat longer hydrogen bond, N44—H44B···O11, also links the two complexes. Hydrogen bonding to the lattice water molecule O1 links the pairs of Cu^{II} complexes into a chain along the *b* axis. These hydrogen bonds are also shown in the packing diagrams, Figs. 2 and 3. Two hydrogen bonds link the pairs of complexes to the CuCN network, and these are shown in blue in Figs. 2 and 3. There may be other weaker interactions with the network, but their distances are outside the 3.2 Å limit that we set.

The [Cu₄(CN)₆]²⁻ units making up the diperiodic network form planar honeycomb networks made up of 18-membered CuCN rings, parallel to plane (101) in the crystal. Each of the four independent Cu atoms involved is close to coplanar with its three coordinated CN groups, with maximum deviation of Cu atom from its neighbours of 0.068 (4) Å for Cu4. Each of these Cu atoms is distorted from trigonal planar coordination in the same way: one of the three bond angles at Cu is larger, average 128.1 (7)°, than the other two, which average 115.9 (10)° (standard deviations given are of the mean). The average Cu—(C/N) distance for the two bonds surrounding the larger angle is slightly shorter than the third Cu—(C/N) bond length. The angle distortions lead to the 18-membered

**Figure 2**

Packing diagram, showing the structure viewed down the *c* axis. Colours as in Fig. 1; All H atoms and C26b (disordered methyl) are omitted. Hydrogen bonds between the Cu^{II} complexes are shown as dashed green bonds, while those between the complexes and CN groups of the polymeric network are shown in blue.

**Figure 3**

Packing diagram, showing the structure viewed down the b axis. Colours and hydrogen bonds as in Fig. 1. The CuCN honeycomb networks are seen edge-on in this projection.

CuCN rings being somewhat lengthened in the direction of the screw axes.

The first organic CuCN complex described in the literature (Williams *et al.*, 1972) had a similar mixed-valence structure to the one described here. In that case, a three-dimensional Cu^ICN network hosts guest [Cu(en)₂H₂O]²⁺ cations, where en = ethylenediamine. In a search of the Cambridge Structural Database (CSD, Version 5.35; Groom *et al.*, 2016), we found relatively few other organic CuCN network structures of this type. Entries COXRIR (Benmansour *et al.*, 2009) and COXRIR01 (Etaiw *et al.*, 2015) describe a diperiodic Cu^ICN network hosting Cu(en)₂ cations, and entry UGUTOF (Colacio *et al.*, 2002) describes a three-dimensional Cu^ICN network with guest Cu^{II} cations coordinated by 2-methyl-ethylenediamine. There are also three inorganic CuCN networks with guest [Cu(NH₃)₄]²⁺ cations.

Synthesis and crystallization

A mixture of 5.02 mmol CuCN and 8.12 mmol NaCN was added to 20 ml of H₂O and stirred until all the mixture had dissolved. In a separate container, 10.06 mmol of 2-amino-1-butanol were dissolved in 10 ml H₂O and added to the solution while stirring under heat. The solution immediately developed a faint purple tint. The pH was 11.9. The beaker was covered and allowed to sit for approximately 72 h, after which point a heterogeneous mixture of navy blue crystals and pale blue material was recovered. The structure presented here is based upon diffraction data from one of the dark blue crystals. IR spectra (cm⁻¹): 2117 (*s*), (CN stretch); 3440 (*versus*, broad) (O—H) stretch; 3328 (*sh*), 3272 (*sh*) (N—H stretch). We have not identified any sharp OH peak that might

Computer programs: *KappaCCD Server Software* (Nonius, 1997), *DENZO* and *SCALEPACK* (Otwinowski & Minor, 1997), *SHELXS97* (Sheldrick, 2008), *SHELXL2019/2* (Sheldrick, 2015), *ORTEPIII* (Burnett & Johnson, 1996) and *publCIF* (Westrip, 2010).

be expected for the strong O—H · · · O hydrogen bonds in the structure.

Refinement

Crystal data, data collection and structure refinement details are summarized in Table 2. Only reflections with a resolution up to 0.80 Å were used in the refinement, as the data in the shell beyond this had just 14% of reflections with $I > 2\sigma(I)$. C- and N-bound H atoms were fixed in their expected positions, while O-bound H atoms were refined, with restraints. N-bound H atoms were fixed because refinements of these atoms did not provide any more satisfactory geometry. Their initial placement was facilitated by use of difference maps based upon low order data, and by the *SHELXL* HFIX 83 instruction (Sheldrick, 2015). The terminal CH₃ group of the ethyl group in base O21 · · · C26 is modelled as disordered between two possible orientations, with occupancies 0.615 (19) and 0.385 (19). In the polymeric part, all bridging cyano ligands were modelled over two orientations, head-to-tail and tail-to-head, since this ligand, while coordinating Cu^I, has no strong

preference for any orientation. Both atomic sites in each C≡N group is then a mixture of C and N atoms. Atoms sharing the same site were constrained to have the same coordinates and displacement parameters, and their occupancies were fixed or refined using free variables: 0.5/0.5 for C1≡N1, 0.69 (8)/0.31 (8) for C2≡N2, 0.70 (8)/0.30 (8) for C3≡N3, 0.65 (8)/0.35 (8) for C4≡N4, 0.5/0.5 for C5≡N5 and 0.79 (8)/0.21 (8) for C6≡N6.
